Lecture 1

- How we study atoms:
 - emission and absorption of light
 - spectral lines
- Atomic orders of magnitude
- Basic structure of atoms
 - approximate electric field inside atoms

Atomic radiation

Spectral Line Broadening

Homogeneous e.g.

Lifetime (Natural)

Collisional (Pressure)

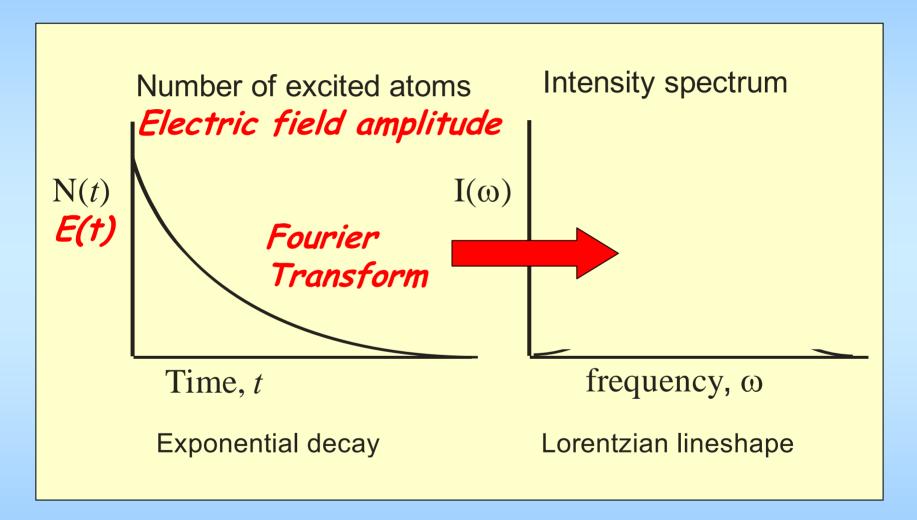

Inhomogeneous e.g.

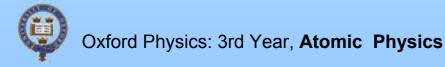

Doppler (Atomic motion)

Crystal Fields

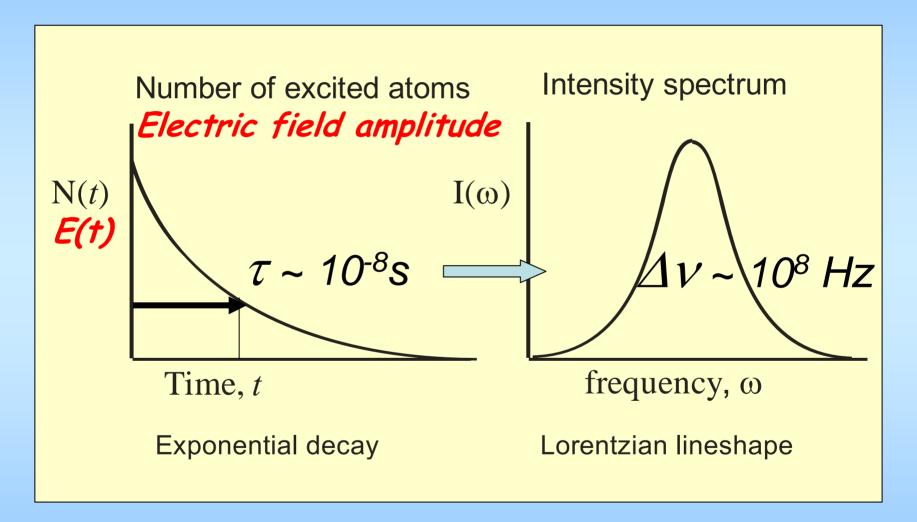

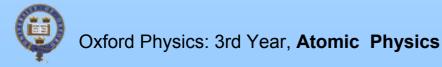

Lifetime (natural) broadening

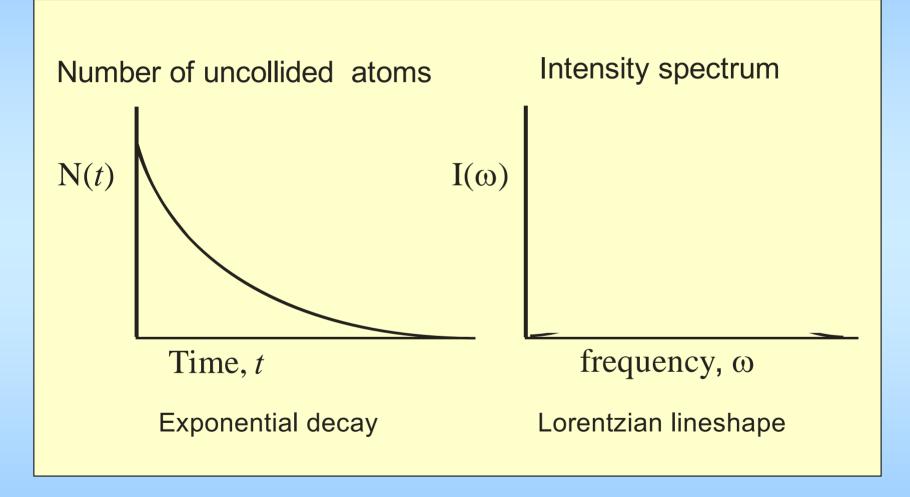

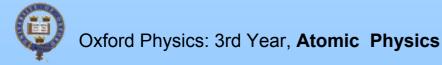

Lifetime (natural) broadening

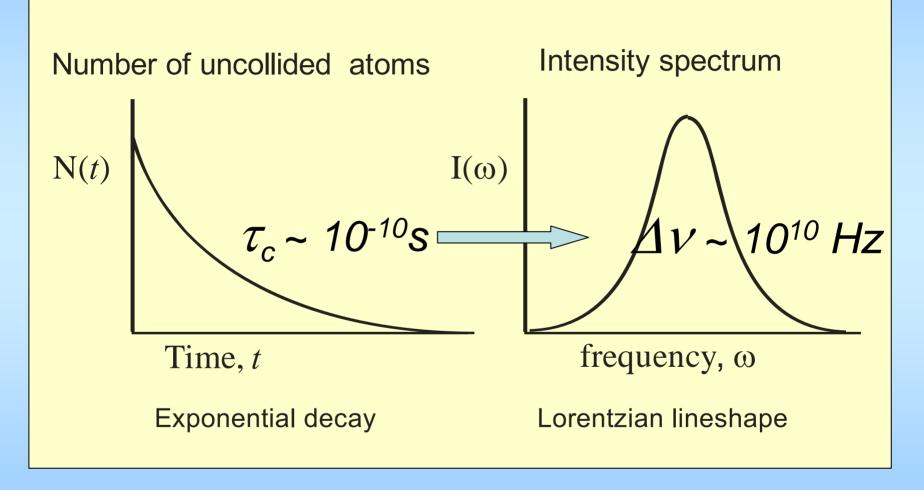

Collision (pressure) broadening

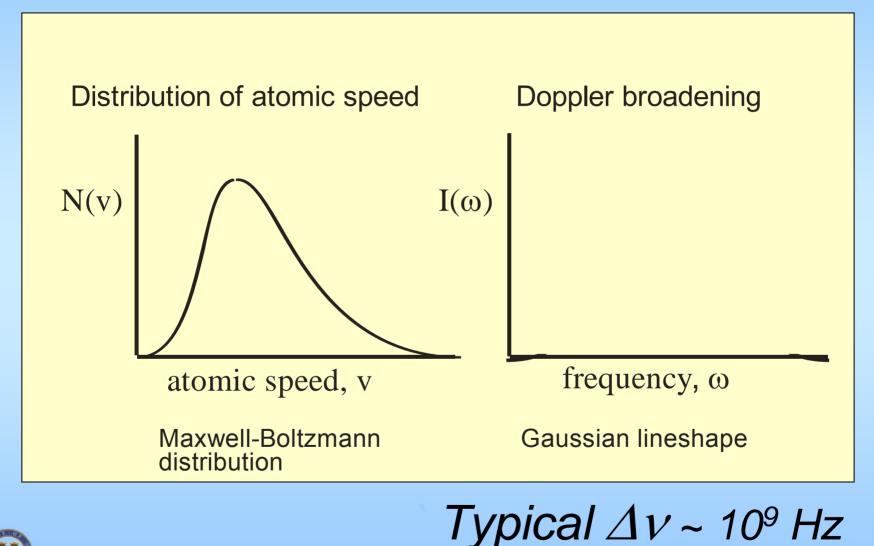

Collision (pressure) broadening

Doppler (atomic motion) broadening

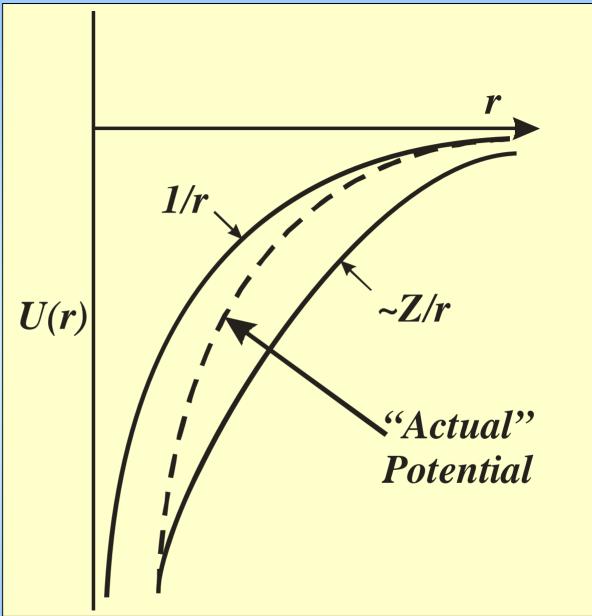

Atomic orders of magnitude

 $10^{-19} \text{ J} \rightarrow \sim 2 \text{ eV}$ Atomic energy: $^{1}/_{40} \text{ eV}$ Thermal energy: 13.6 eV Ionization energy, H: = Rydberg Constant 109,737 cm⁻¹ Atomic size, Bohr radius: 5.3 x 10⁻¹¹m Fine structure constant, $\alpha = v/c$: 1/137 9.27 x 10⁻²⁴ JT⁻¹ Bohr magneton, $\mu_{\rm B}$:

The Central Field

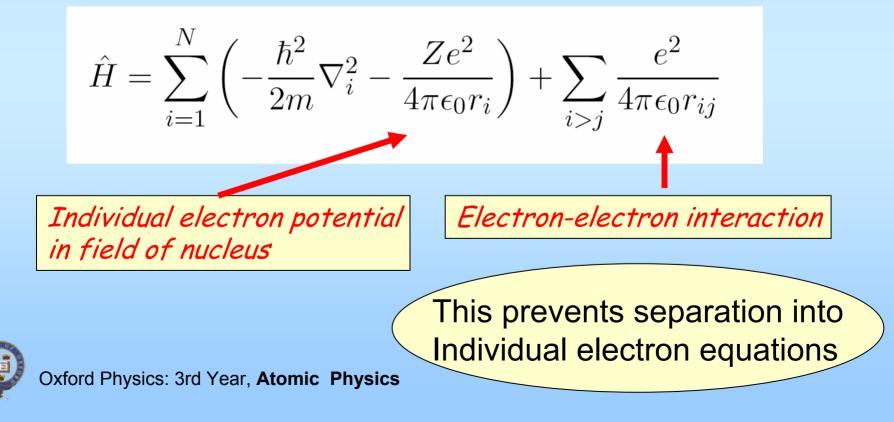

Lecture 2

- The Central Field Approximation:
 physics of wave functions (Hydrogen)
- Many-electron atoms
 - atomic structures and the Periodic Table
- Energy levels
 - deviations from hydrogen-like energy levels
 - finding the energy levels; the quantum defect

Schrödinger Equation (1-electron atom)

$$-\frac{\hbar^2}{2m}\nabla^2\psi - \frac{Ze^2}{4\pi\epsilon_0 r}\psi = E\psi$$

Hamiltionian for many-electron atom:

Central potential in Hydrogen:

 $V(r) \sim 1/r$,

separation of ψ into radial and angular functions:

$$\psi = R(r) Y^{m}{}_{l}(\theta, \phi) \chi(m_{s})$$

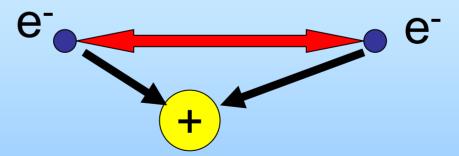

Therefore we seek a potential for multi-electron atom that allows separation into individual electron wave-functions of this form

Electron – Electron interaction term:

 $\sum_{i>i} \frac{\epsilon}{4\pi\epsilon_0 r_{ij}}$

Treat this as composed of two contributions: (a)a centrally directed part (b)a non-central **Residual Electrostatic** part

Hamiltonian for Central Field Approximation

$$\hat{H} = \hat{H}_0 + \hat{H}_1$$
where $\hat{H}_0 = \sum_i \left\{ -\frac{\hbar^2}{2m} \nabla_i^2 + U(r_i) \right\}$
Central Field Potential

 \hat{H}_1 = residual electrostatic interaction

Perturbation Theory Approximation:
$$\hat{H}_1 << \hat{H}_o$$

Zero order Schrödinger Equation: $\hat{H}_0 \ \psi = E_0 \ \psi$

 \hat{H}_0 is spherically symmetric so equation is separable - solution for individual electrons:

$$\psi(n, l, m_l, m_s) = R'_{n,l}(r)Y_l^m(\theta, \phi)\chi(m_s)$$

Radial Angular Spin

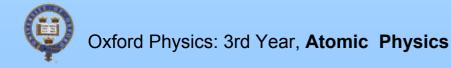

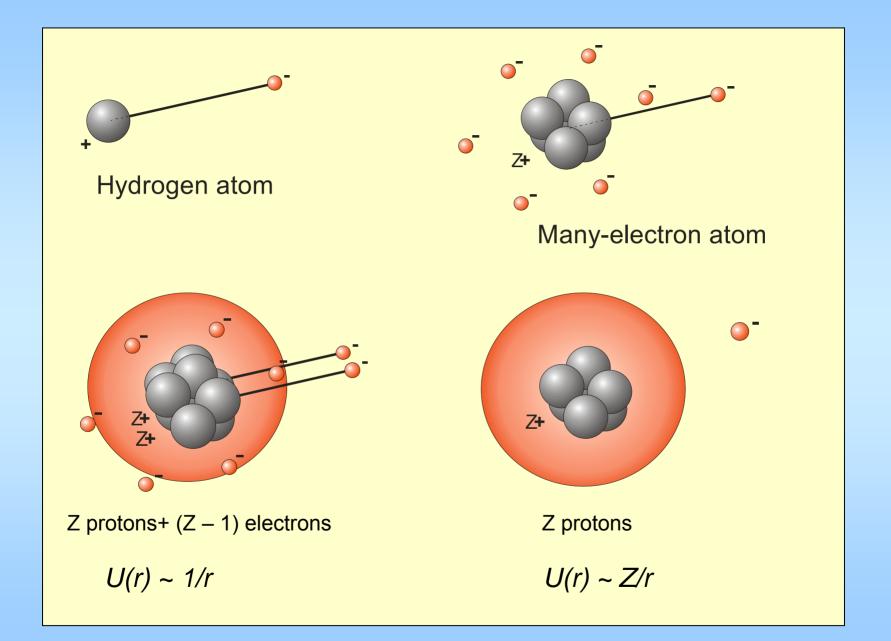

Central Field Approximation:

$$\hat{H} = \hat{H}_0 + \hat{H}_1$$

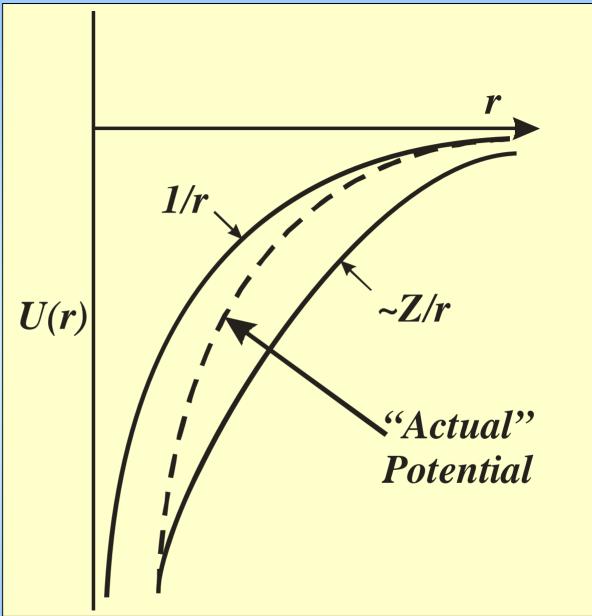

where $\hat{H}_0 = \sum_i \left\{ -\frac{\hbar^2}{2m} \nabla_i^2 + U(r_i) \right\}$

What form does $U(r_i)$ take?

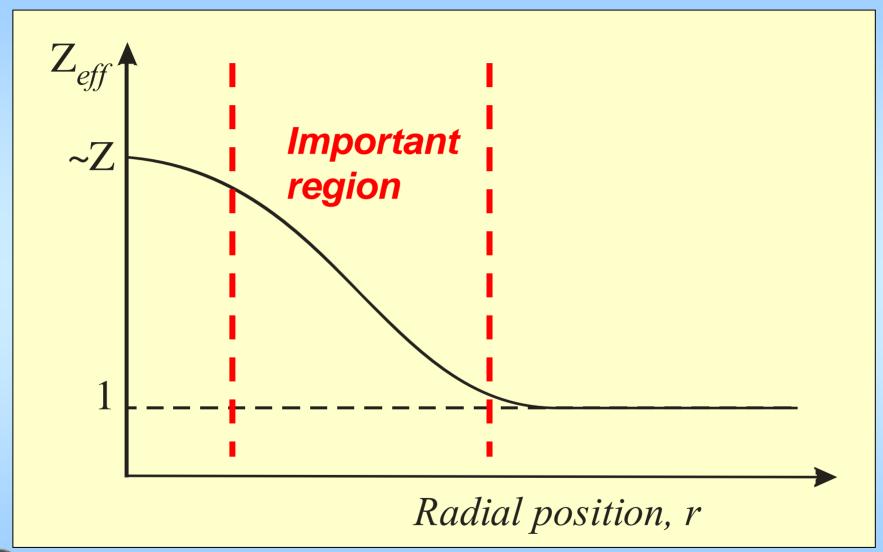

The Central Field

Finding the Central Field

- "Guess" form of U(r)
- Solve Schrödinger eqn. \rightarrow Approx ψ .
- Use approx ψ to find charge distribution
- Calculate $U_c(r)$ from this charge distribution
- Compare $U_c(r)$ with U(r)
- Iterate until $U_c(r) = U(r)$

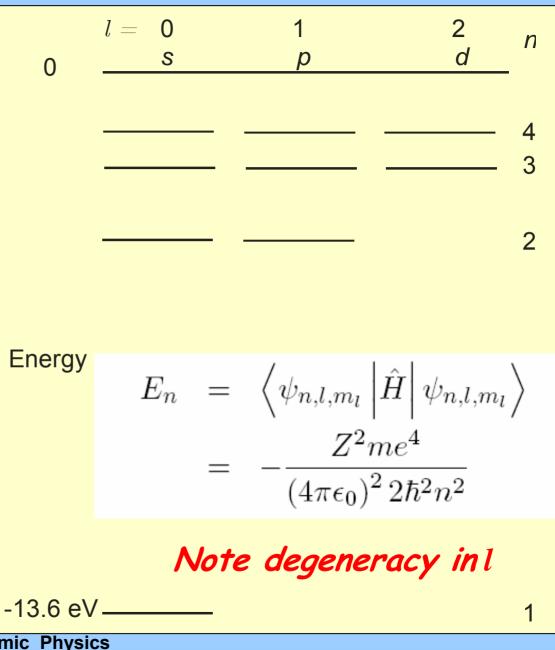

Energy eigenvalues for Hydrogen:

$$E_n = \left\langle \psi_{n,l,m_l} \left| \hat{H} \right| \psi_{n,l,m_l} \right\rangle$$
$$= -\frac{Z^2 m e^4}{\left(4\pi\epsilon_0\right)^2 2\hbar^2 n^2}$$

H Energy level diagram

Revision of Hydrogen solutions:

Product wavefunction: Spatial x Angular function

Normalization

$$\int R_{n,l}^2(r)r^2dr = 1 \qquad \int \left|Y_l^{m_l}(\theta,\phi)\right|^2 d\Omega = 1$$

$Y_l^{m_l}(\theta,\phi)$: Eigenfunctions of angular momentum operators

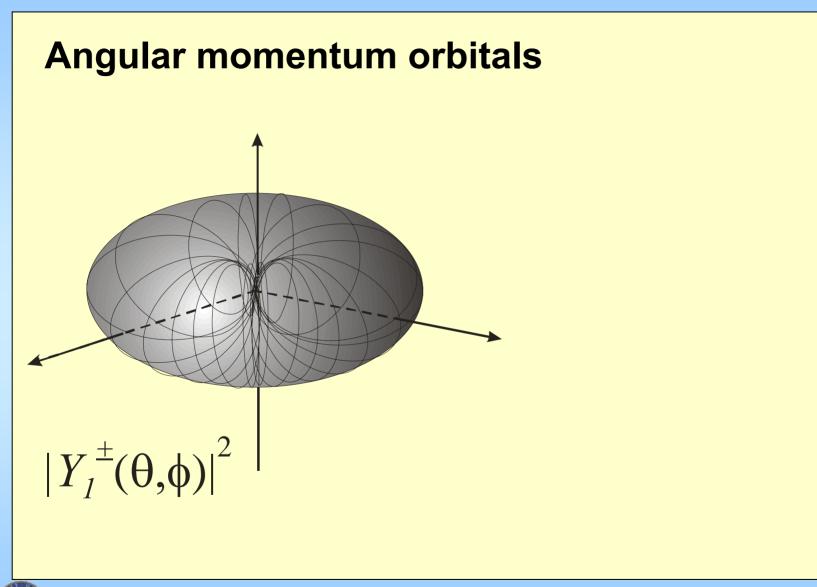

$$\hat{l}^2 Y_l^{m_l}(\theta, \phi) = l(l+1)\hbar^2 Y_l^{m_l}(\theta, \phi)$$
$$\hat{l}_z Y_l^{m_l}(\theta, \phi) = m_l \hbar Y_l^{m_l}(\theta, \phi)$$

 $\psi_{n,l,m_l}(r,\theta,\phi) = R_{n,l}(r)Y_l^{m_l}(\theta,\phi)$

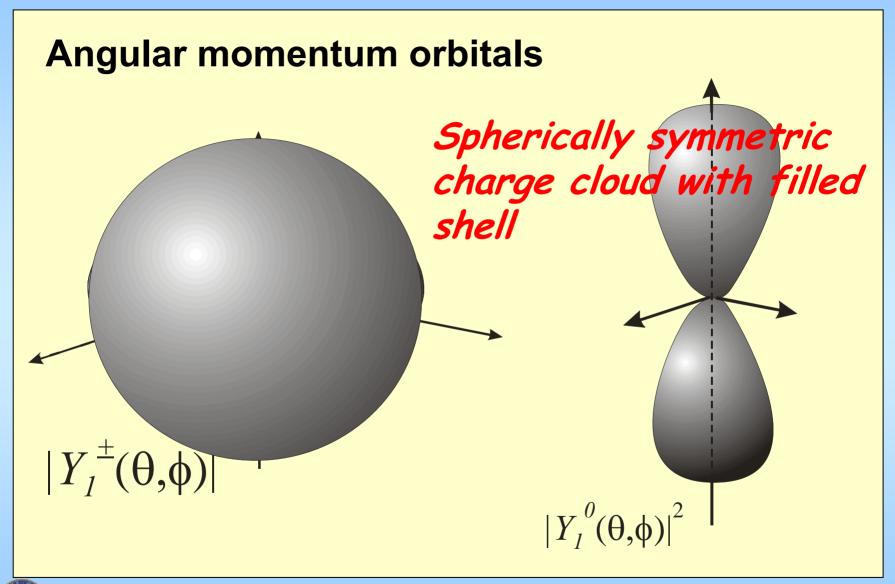

Eigenvalues

$$l = 0, 1, 2...(n-1)$$
 $-l \le m_l \le l$

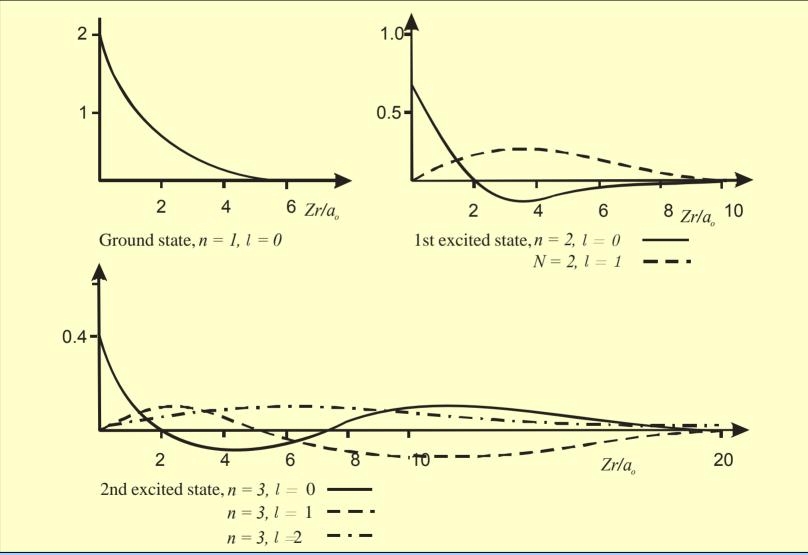

Radial wavefunctions

Oxford Physics: 3rd Year, Atomic Physics

Radial wavefunctions

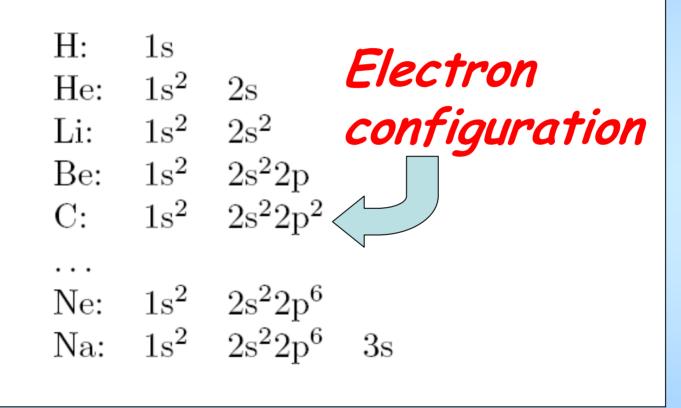

- l = 0 states do not vanish at r = 0
- $l \neq 0$ states vanish at r = 0, and peak at larger r as l increases
- Peak probability (size) ~ n^2
- l = 0 wavefunction has (n-1) nodes
- l = 1 has (n-2) nodes etc.
- Maximum l=(n-1) has no nodes

Electrons arranged in "shells" for each n

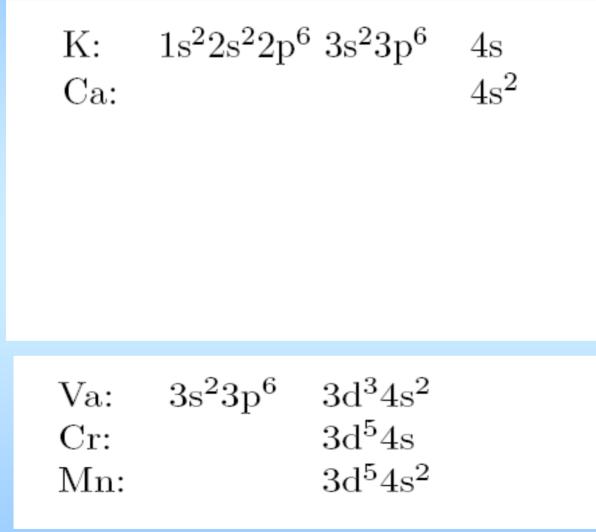

The Periodic Table

Shells specified by *n* and *l* quantum numbers

The Periodic Table

Oxford Physics: 3rd Year, Atomic Physics

The Periodic Table *Rare gases*

He:
$$1s^2$$

Ne: $1s^22s^22p^6$
Ar: $1s^22s^22p^63s^23p^6$
Kr: (...) $4s^24p^6$
Xe: (....) $5s^25p^6$
Rn: (....) $6s^26p^6$

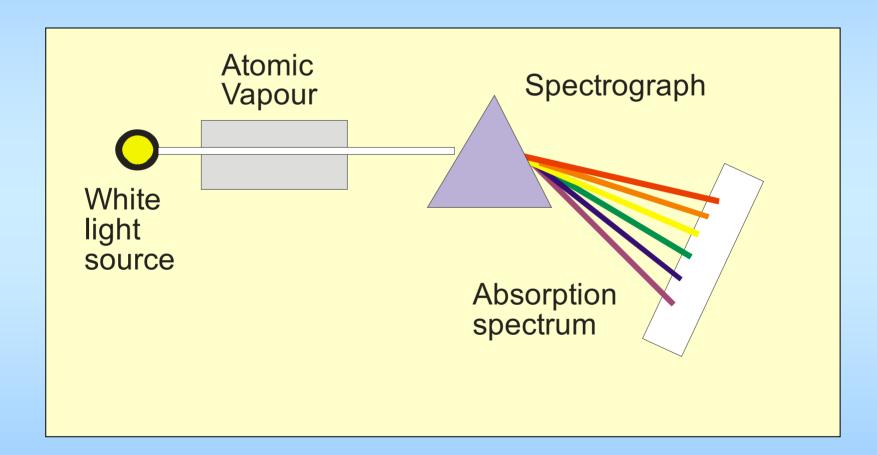

The Periodic Table *Alkali metals*

Li:
$$1s^{2}2s$$

Na: $1s^{2}2s^{2}2p^{6}3s$
Ca: $1s^{2}2s^{2}2p^{6}3s^{2}3p^{6}4s$
Rb: (...) $4s^{2}4p^{6}5s$
Cs: (....) $5s^{2}5p^{6}6s$
etc.

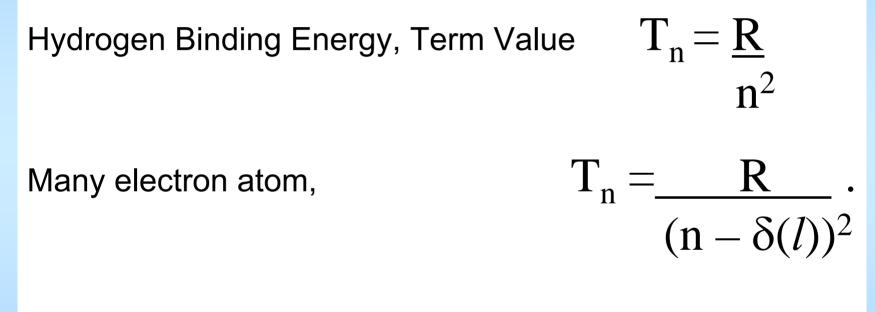

Absorption spectroscopy

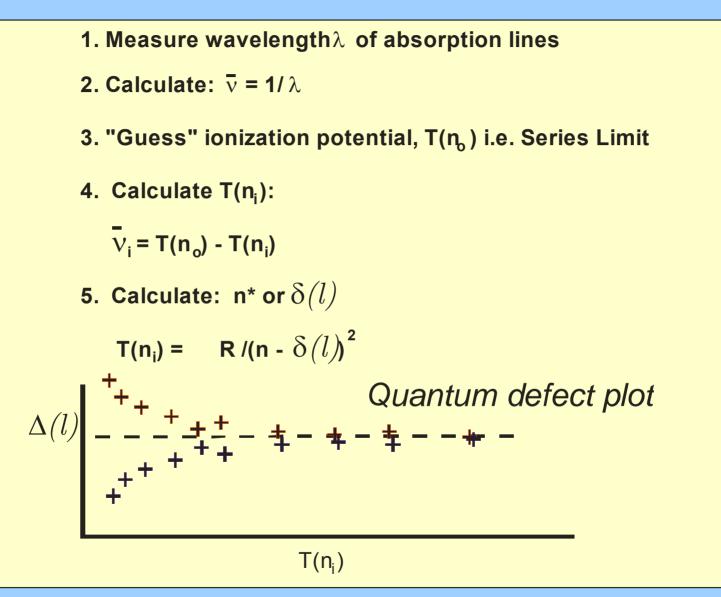

Finding the Energy Levels

$\delta(l)$ is the Quantum Defect

Finding the Quantum Defect

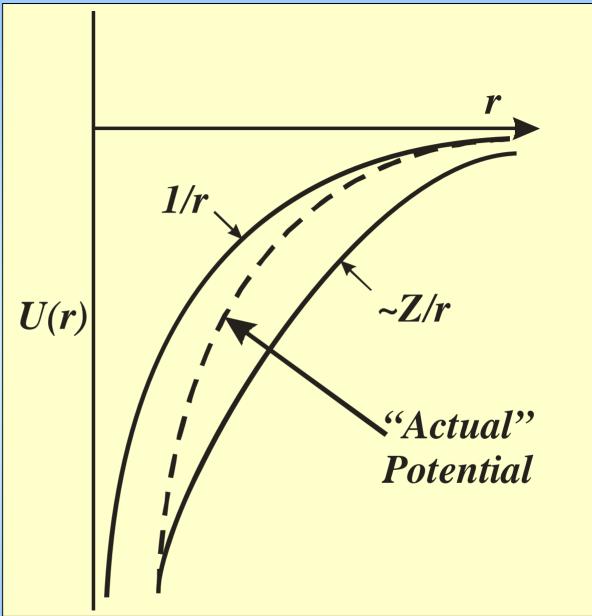

Oxford Physics: 3rd Year, Atomic Physics

Lecture 3

- Corrections to the Central Field
- Spin-Orbit interaction
- The physics of magnetic interactions
- Finding the S-O energy Perturbation Theory
- The problem of degeneracy
- The Vector Model (DPT made easy)
- Calculating the Spin-Orbit energy
- Spin-Orbit splitting in Sodium as example

The Central Field

Corrections to the Central Field

• Residual electrostatic interaction:

$$\hat{H}_1 = \sum_{i>j} \frac{e^2}{4\pi\epsilon_0 r_{ij}} - \sum_i \left\{ \frac{Ze^2}{4\pi\epsilon_0 r_i} + U(r_i) \right\}$$

• Magnetic spin-orbit interaction:

$$\hat{H}_2 = -\underline{\mu}.\underline{B}_{\text{orbit}}$$

Magnetic spin-orbit interaction

- Electron moves in Electric field of nucleus, so sees a Magnetic field *B*_{orbit}
- Electron spin precesses in B_{orbit} with energy: - μ .B which is proportional to <u>s</u>.<u>l</u>
- Different orientations of \underline{s} and \underline{l} give different total angular momentum $\underline{j} = \underline{l} + \underline{s}$.
- Different values of j give different <u>s.l</u> so have different energy:

The energy level is split for $l \pm 1/2$

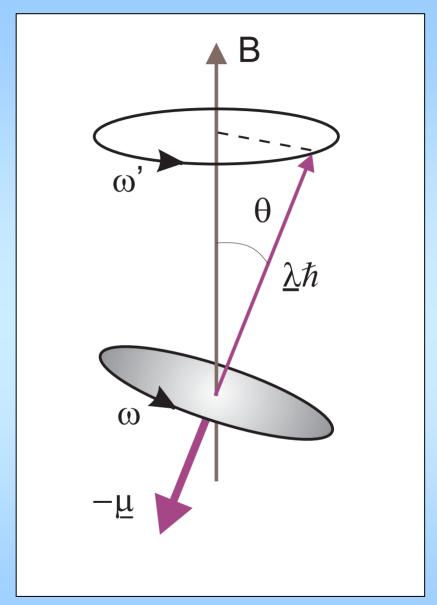

Larmor Precession

Magnetic field B exerts a torque on magnetic moment μ causing precession of μ and the associated angular momentum vector $\underline{\lambda}$

The additional angular velocity ω' changes the angular velocity and hence energy of the orbiting/spinning charge

$$\Delta E = - \underline{\mu} \cdot \underline{B}$$

Spin-Orbit interaction: Summary

$$\underline{B} = -\frac{\underline{v} \times \underline{E}}{c^2} \qquad \underline{B} = -\frac{1}{mc^2} \underline{p} \times \underline{r} \frac{|\underline{E}|}{|\underline{r}|} \qquad \underline{B} = \frac{1}{mc^2} \frac{|\underline{E}|}{|\underline{r}|} \hat{\underline{l}}$$
$$|\underline{E}| = -\frac{\partial \phi(r)}{\partial r} \qquad |\underline{E}| = -\frac{1}{e} \frac{\partial U(r)}{\partial r}$$
$$\underline{B} = \frac{1}{emc^2} \frac{1}{|\underline{r}|} \frac{\partial U(r)}{\partial r} \hat{\underline{l}} \qquad \underline{B} \text{ parallel to } \underline{\underline{l}}$$
$$\underline{\mu}_s = -g_s \frac{\mu_B}{\hbar} \hat{\underline{s}} \qquad \underline{\mu} \text{ parallel to } \underline{\underline{s}}$$
$$-\underline{\mu}_s \cdot \underline{B} \propto \frac{1}{r} \frac{\partial U(r)}{\partial r} \hat{\underline{s}} \cdot \hat{\underline{l}}$$

Oxford Physics: 3rd Year, Atomic Physics

Perturbation energy

$$-\underline{\mu}_{s} \cdot \underline{B} = \frac{\mu_{0}}{4\pi} Z g_{s} \mu_{B}^{2} \frac{1}{r^{3}} \frac{\underline{\hat{s}} \cdot \underline{\hat{l}}}{\hbar^{3}}$$

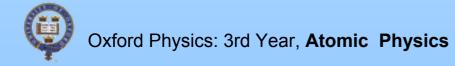

Radial integral

$$\left\langle \frac{1}{r^3} \right\rangle = \frac{Z^3}{n^3 a_0^3 l (l+1/2) (l+1)}$$

Angular momentum operator

$$\underline{\hat{s}} \cdot \underline{\hat{l}} = \mathbf{?}$$

How to find
$$\langle \underline{\hat{s}} | \hat{\underline{l}} \rangle$$
 using perturbation theory?

Perturbation theory with degenerate states

Perturbation Energy:

$$\Delta E = \left\langle \psi_i \right| \hat{H}' \left| \psi_i \right\rangle$$

Change in wavefunction: So won't work if $E_i = E_j$ i.e. degenerate states.

$$\Delta \psi_{i} = \sum_{j \neq i} \frac{\left\langle \psi_{j} \right| \hat{H}' \left| \psi_{i} \right\rangle}{E_{i} - E_{j}} \psi_{j}$$

We need a diagonal perturbation matrix, i.e. off-diagonal elements are zero

 $\left\langle \psi_{1}\right|\hat{H}^{\prime}\left|\psi_{2}\right\rangle =0$

New wavefunctions:

New eignvalues:

$$\phi_1 = a\psi_1 + b\psi_2$$

$$\phi_2 = b^*\psi_1 - a^*\psi_2$$

$$\langle \phi_1 | \hat{H}' | \phi_2 \rangle = 0$$

$$\Delta E_1 = \langle \phi_1 | \hat{H}' | \phi_1 \rangle, \ \Delta E_2 = \langle \phi_2 | \hat{H}' | \phi_2 \rangle$$

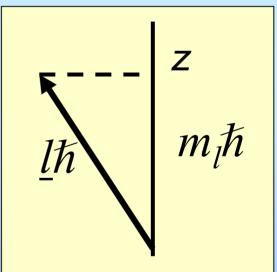

Oxford Physics: 3rd Year, Atomic Physics

The Vector Model

Angular momenta represented by vectors: \underline{l}^2 , \underline{s}^2 and \underline{j}^2 , and \underline{l} , $\underline{s} \underline{j}$ and with magnitudes: l(l+1), s(s+1) and j(j+1). and $\sqrt{l(l+1)}$, $\sqrt{s(s+1)}$ and $\sqrt{j(j+1)}$.

Projections of vectors: $\underline{l}, \underline{s}$ and \underline{j} on z-axis are $\underline{m}_{l}, \underline{m}_{s}$ and \underline{m}_{j}

Constants of the Motion - Good quantum numbers

Summary of Lecture 3: Spin-Orbit coupling

• Spin-Orbit energy

$$-\,\underline{\mu}_{s}\cdot\underline{B}\propto\frac{1}{r}\frac{\partial U(r)}{\partial r}\underline{\hat{s}}\cdot\underline{\hat{l}}$$

• Radial integral sets size of the effect.

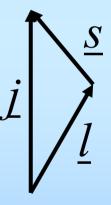

$$\left\langle \frac{1}{r^3} \right\rangle = \frac{Z^3}{n^3 a_0^3 l (l+1/2)(l+1)}$$

- Angular integral $< \underline{s}$. $\underline{l} >$ needs Degenerate Perturbation Theory
- New basis eigenfunctions:

$$\langle n, l, s, j, m_j |$$

- j and j_z are constants of the motion
- Vector Model represents angular momenta as vectors
- These vectors can help identify constants of the motion
- These constants of the motion represented by good quantum numbers

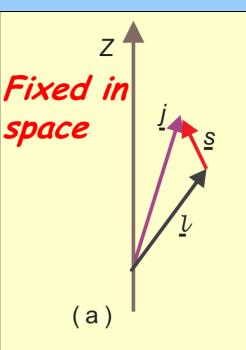

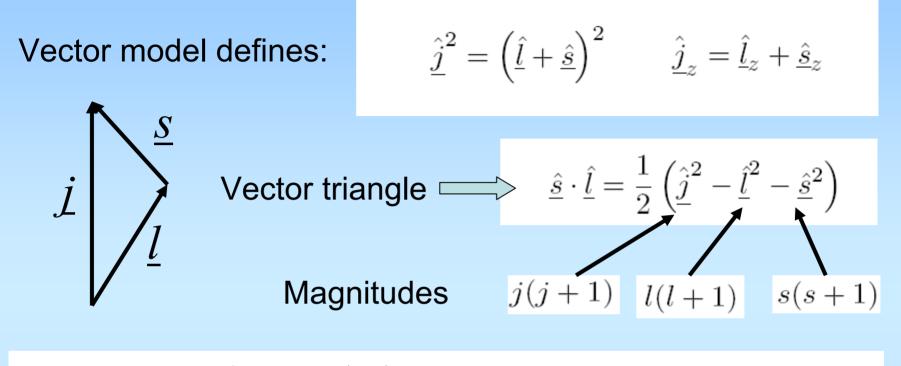

(a) No spin-orbit coupling
(b) Spin-orbit coupling gives precession around *j*(c) Projection of <u>l</u> on z is not constant
(d) Projection of <u>s</u> on z is not constant

 m_l and m_s are not good quantum numbers Replace by *j* and m_j

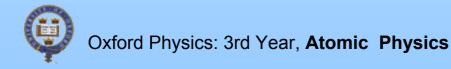

Oxford Physics: 3rd Year, Atomic Physics

 $\langle n, l, s, j, m_j | \underline{\hat{s}} \cdot \underline{\hat{l}} | n, l, s, j, m'_j \rangle = 0$ unless j = j' and $m_j = m'_j$

$$\langle n, l, s, j, m_j | \underline{\hat{s}} \cdot \underline{\hat{l}} | n, l, s, j, m_j \rangle = \frac{1}{2} \{ j(j+1) - l(l+1) - s(s+1) \} \hbar^2$$

$$-\underline{\mu}_{s} \cdot \underline{B} \propto \frac{1}{r} \frac{\partial U(r)}{\partial r} \underline{\hat{s}} \cdot \underline{\hat{l}} \qquad \sim \beta_{n,l} \times \langle \frac{1}{2} \{ \underline{j}^{2} - \underline{l}^{2} - \underline{s}^{2} \} \rangle$$

Using basis states: $|n, l, s, j, m_j\rangle$ to find expectation value:

The spin-orbit energy is:

$$\Delta E = \beta_{n,l} \times (1/2) \{ j(j+1) - l(l+1) - s(s+1) \}$$

$$\Delta E = \beta_{n,l} \mathbf{x} (1/2) \{ j(j+1) - l(l+1) - s(s+1) \}$$

Sodium 3s: n = 3, l = 0,no effect **3p:** n = 3, l = 1, $s = \frac{1}{2}$, $-\frac{1}{2}$, $j = \frac{1}{2}$ or $\frac{3}{2}$ $\Delta E(1/2) = \beta_{3p} \mathbf{x} (-1); \quad \Delta E(3/2) = \beta_{3p} \mathbf{x} (1/2)$ j = 3/2 | 2j + 1 = 4 | 1/2 3p (no spin-orbit) j = 1/2 |2j + 1 = 2 |-1|

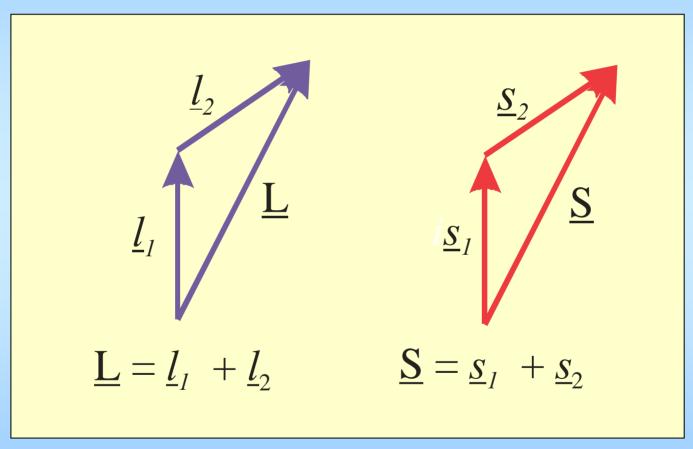

Lecture 4

- Two-electron atoms: the residual electrostatic interaction
- Adding angular momenta: LS-coupling
- Symmetry and indistinguishability
- Orbital effects on electrostatic interaction
- Spin-orbit effects

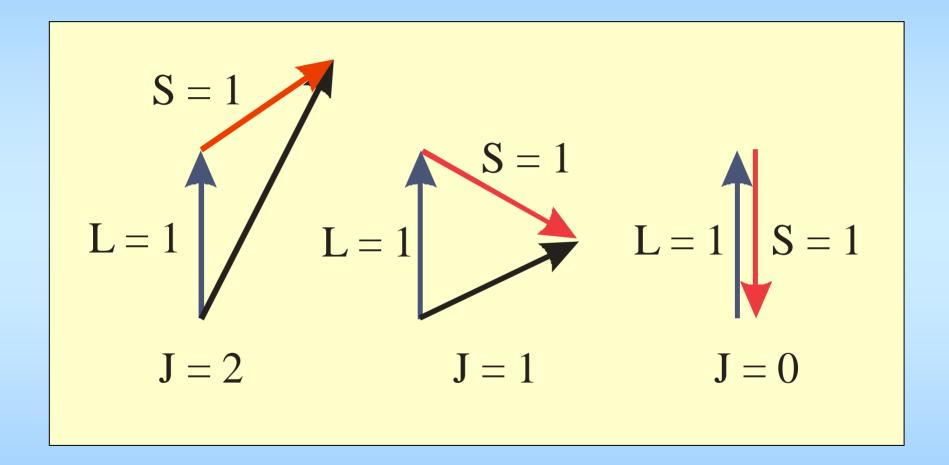

Coupling of $\underline{l}_{\underline{i}}$ and \underline{s} to form \underline{L} and \underline{S} : Electrostatic interaction dominates

Coupling of <u>L</u> and <u>S</u> to form <u>J</u>

Magnesium: "typical" 2-electron atom

Mg Configuration:

 $1s^{2}2s^{2}2p^{6}3s^{2}$

 $1s^{2}2s^{2}2p^{6}3s$

Na Configuration:

"Spectator" electron in Mg

Mg energy level structure is like Na but levels are more strongly bound

Oxford Physics: 3rd Year, Atomic Physics

Residual electrostatic interaction

$$\hat{H}_1 = -\sum_i \frac{Ze^2}{4\pi\epsilon_0 r_i} + \sum_{i>j} \frac{e^2}{4\pi\epsilon_0 r_{ij}} - \sum_i U(r_i)$$

3s4s state in Mg: Zero-order wave functions

$$|\psi_1(3s)\psi_2(4s)\rangle$$

Perturbation energy:

$$\Delta E_1 \neq \langle \psi_1(3s)\psi_2(4s) | \hat{H}_1 | \psi_1(3s)\psi_2(4s) \rangle$$
Degenerate states

Linear combination of zero-order wave-functions

$$\phi_1 = \frac{1}{\sqrt{2}} \left(\psi_1(3s)\psi_2(4s) + \psi_1(4s)\psi_2(3s) \right)$$

$$\phi_2 = \frac{1}{\sqrt{2}} \left(\psi_1(3s)\psi_2(4s) - \psi_1(4s)\psi_2(3s) \right)$$

Off-diagonal matrix elements:

$$\frac{1}{2} \langle \psi_1(3s)\psi_2(4s) + \psi_1(4s)\psi_2(3s) | V | \psi_1(3s)\psi_2(4s) - \psi_1(4s)\psi_2(3s) \rangle$$

$$1 \uparrow \qquad 2 \uparrow \qquad 3 \uparrow \qquad 4 \uparrow$$

Off-diagonal matrix elements:

$$\frac{1}{2} \langle \psi_1(3s)\psi_2(4s) + \psi_1(4s)\psi_2(3s) | V | \psi_1(3s)\psi_2(4s) - \psi_1(4s)\psi_2(3s) \rangle$$

$$1 \uparrow \qquad 2 \uparrow \qquad 3 \uparrow \qquad 4 \uparrow$$

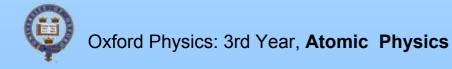

$$1 \times 3 = \langle \psi_1(3s)\psi_2(4s) | V | \psi_1(3s)\psi_2(4s) \rangle = \mathbf{J}$$

$$2 \times 4 = -\langle \psi_1(4s)\psi_2(3s) | V | \psi_1(4s)\psi_2(3s) \rangle = -\mathbf{J}$$

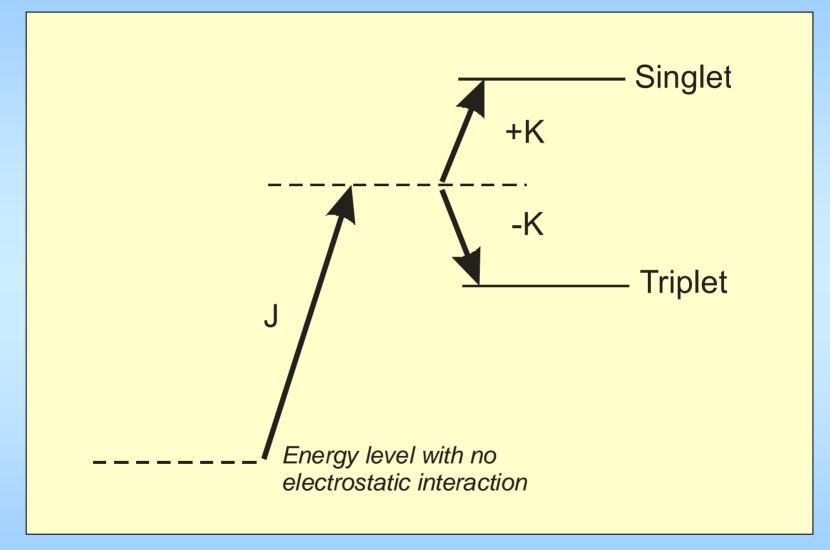

$$2 \times 3 = \langle \psi_1(4s)\psi_2(3s) | V | \psi_1(3s)\psi_2(4s) \rangle = K$$

$$1 \times 4 = -\langle \psi_1(3s)\psi_2(4s) | V | \psi_1(4s)\psi_2(3s) \rangle = -\mathbf{K}$$

Therefore
$$\langle \phi_1 | V | \phi_2 \rangle = 0$$
 as required!

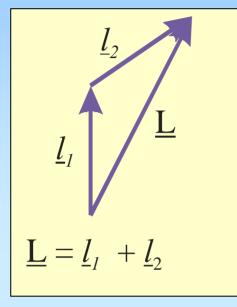

Effect of Direct and Exchange integrals

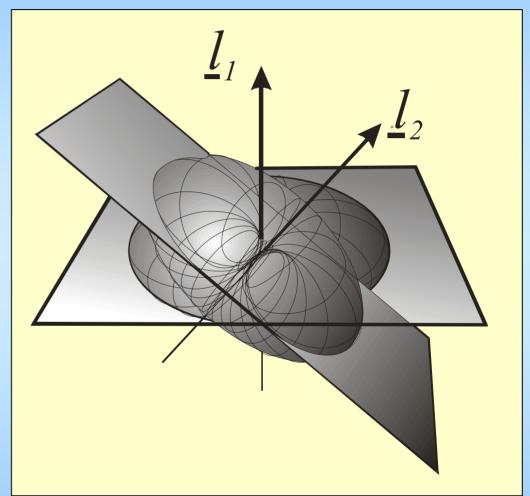

Orbital orientation effect on electrostatic interaction

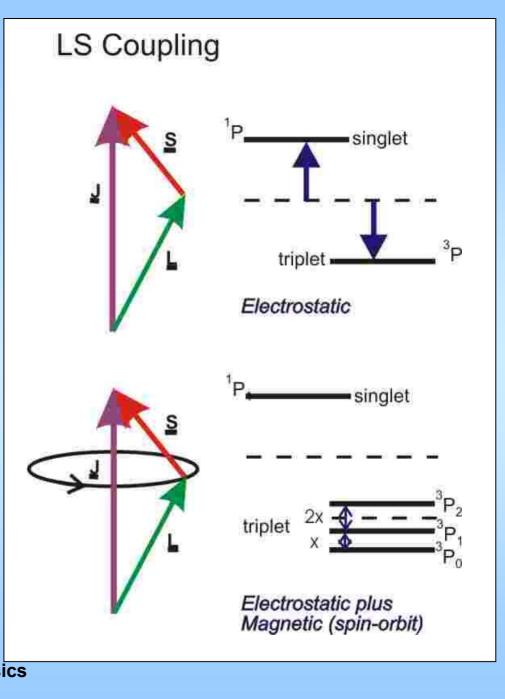

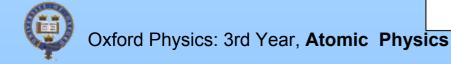

Overlap of electron wavefunctions depends on orientation of orbital angular momentum: so electrostatic interaction depends on <u>L</u>

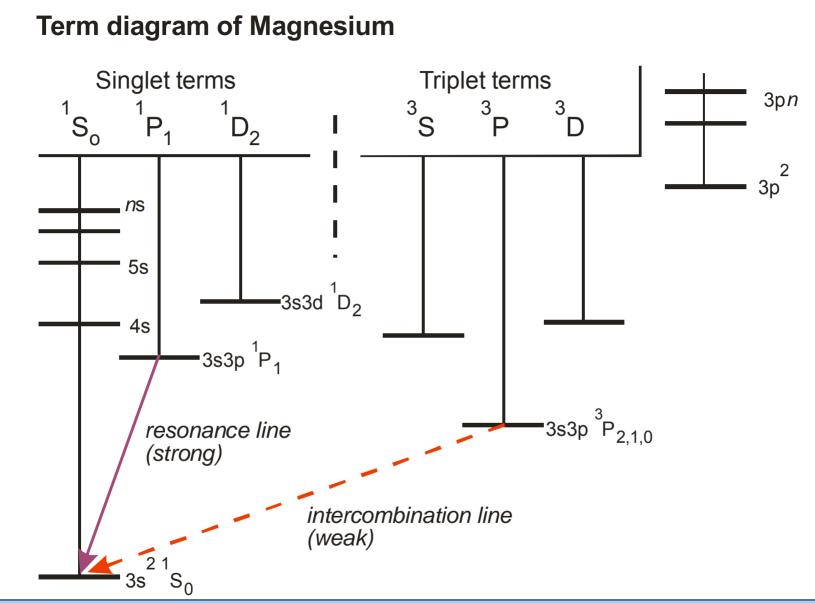

Residual Electrostatic and Spin-Orbit effects in LS-coupling

The story so far: *Hierarchy of interactions*

Central Field configuration, $n_1 l_1 n_2 l_2 \dots$ Residual Electrostatic \rightarrow Terms, $L = S, P, D \dots$ Spin-Orbit \rightarrow Level, $J = |L - S| \rightarrow L + S$

H₃: Nuclear Effects on atomic energy H₃ << H₂ << H₁ << H₀

Oxford Physics: 3rd Year, Atomic Physics

Lecture 5

- Nuclear effects on energy levels
 - Nuclear spin
 - addition of nuclear and electron angular momenta
- How to find the nuclear spin
- •lsotope effects:
 - effects of finite nuclear mass
 - effects of nuclear charge distribution
 - Selection Rules

Nuclear effects in atoms

Nucleus:

Corrections

- stationary Nuclear spin \rightarrow magnetic dipole interacts with electrons
- infinite mass orbits centre of mass with electrons
- point charge spread over
 - nuclear volume

Nuclear Spin interaction

Magnetic dipole ~ angular momentum

$$\mu = -\gamma \underline{\lambda} \hbar$$

$$\mu_{\underline{l}} = -g_{l} \mu_{\underline{B}} \underline{l} \qquad \mu_{\underline{s}} = -g_{\underline{s}} \mu_{\underline{B}} \underline{s}$$

$$\mu_{\underline{I}} = -g_{\underline{I}} \mu_{\underline{N}} \underline{I}$$

$$g_{\underline{I}} \sim 1 \qquad \mu_{\underline{N}} = \mu_{\underline{B}} \times m_{\underline{e}} / m_{\underline{P}} \sim \mu_{\underline{B}} / 2000$$

Perturbation energy:

$$\overset{\mathbf{A}}{\mathbf{H}}_{3} = - \underline{\mu}_{I} \cdot \underline{B}_{el}$$

$$\hat{H}_3 = -\underline{\hat{\mu}}_I \cdot \underline{\hat{B}}_{\rm el}$$

Magnetic field of electrons: Orbital and Spin

Closed shells: zero contribution s orbitals: largest contribution – short range $\sim 1/r^3$ l > 0, smaller contribution – neglect

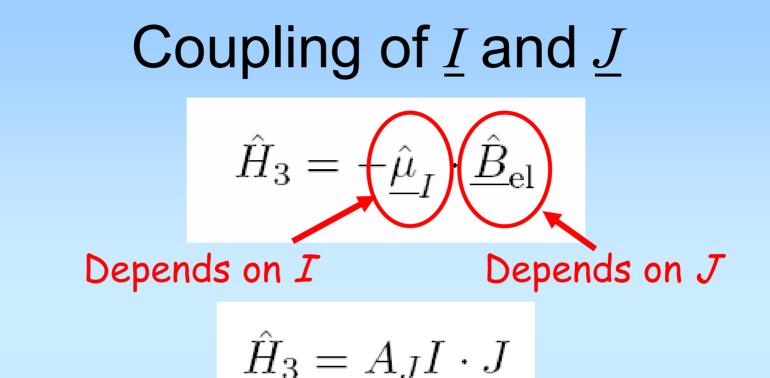

$$B_{\rm el} \sim \frac{\mu_0}{4\pi} \mu_B \left\langle \frac{1}{r^3} \right\rangle.$$
$$B_{\rm el} \sim \frac{\mu_0}{4\pi} \frac{\mu_B}{a_0^3} \sim 6 \mathrm{T}$$

$$\hat{H}_3 = -\underline{\hat{\mu}}_I \cdot \underline{\hat{B}}_{el}$$

$$\underline{B}_{el} = (scalar quantity) \times \underline{J}$$

Usually dominated by spin contribution in s-states:

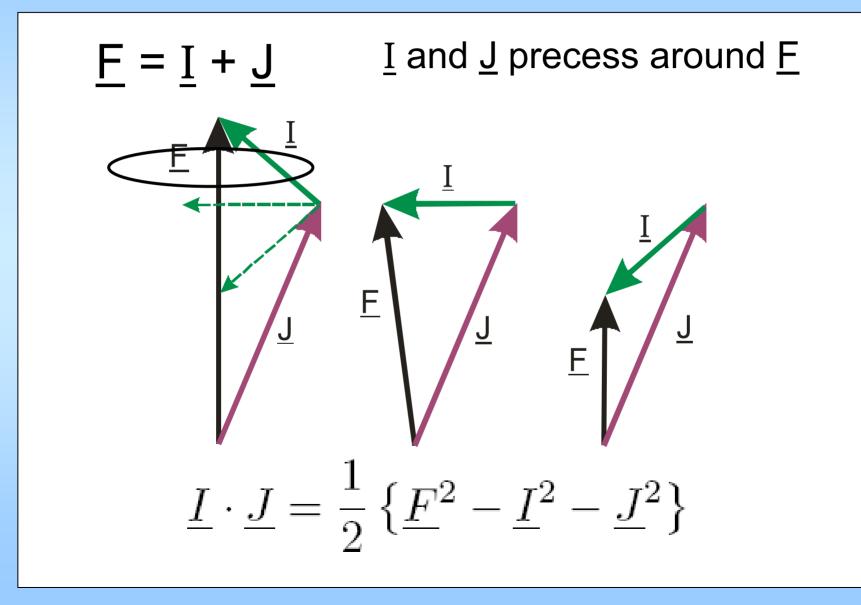

Fermi "contact interaction". Calculable only for Hydrogen in ground state, 1s

Nuclear spin interaction energy:

$$\Delta E = A_J \left\langle \underline{\hat{I}} \cdot \underline{\hat{J}} \right\rangle$$
empirical
Expectation value

Vector model of nuclear interaction

Hyperfine structure

$$\begin{array}{ll} \text{Hfs interaction energy:} & \Delta E = A_J \left\langle \underline{\hat{I}} \cdot \underline{\hat{J}} \right\rangle \\ \text{Vector model result:} & \underline{I} \cdot \underline{J} = \frac{1}{2} \left\{ \underline{F}^2 - \underline{I}^2 - \underline{J}^2 \right\} \\ \text{Hfs energy shift:} \\ & \Delta E = \frac{A_J}{2} \left\{ F(F+1) - I(I+1) - J(J+1) \right\} \end{array}$$

Hfs interval rule:

$$\Delta E_{F'} = \Delta E(F') - \Delta E(F'-1) \sim A_J F'$$

Finding the nuclear spin, I

- Interval rule finds F, then for known $J \rightarrow I$
- Number of spectral lines
 (2I + 1) for J > I, (2J + 1) for I > J
- Intensity

Depends on statistical weight (2F + 1) finds F, then for known $J \rightarrow I$

Isotope effects

reduced mass

 $E_n \sim \frac{Z^2 e^4 m_r}{2\hbar^2 n^2}$

Orbiting about Fixed nucleus, *infinite mass*

Orbiting about centre of mass

Isotope effects

reduced mass

 $E_n \sim \frac{Z^2 e^4 m_r}{2\hbar^2 n^2}$

Orbiting about Fixed nucleus, *infinite mass*

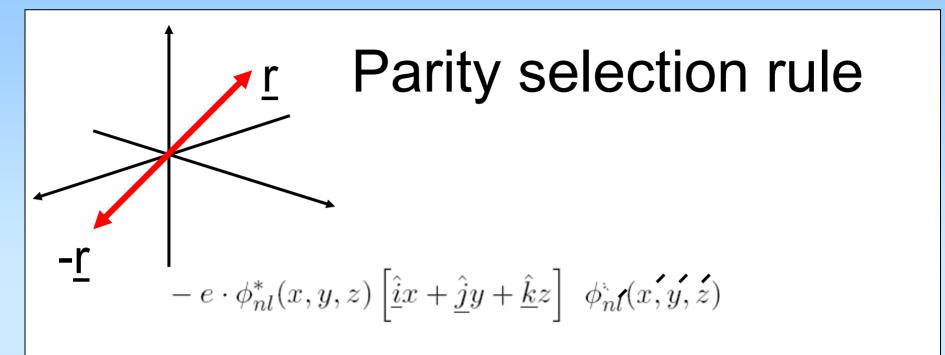

Orbiting about centre of mass

Lecture 6

- Selection Rules
- Atoms in magnetic fields
 - basic physics; atoms with no spin
 - atoms with spin: anomalous Zeeman Effect
 - polarization of the radiation

N.B. Error in notes eqn (161)

Parity
$$(-1)^l$$
 must change
 $\Delta l = \pm 1$

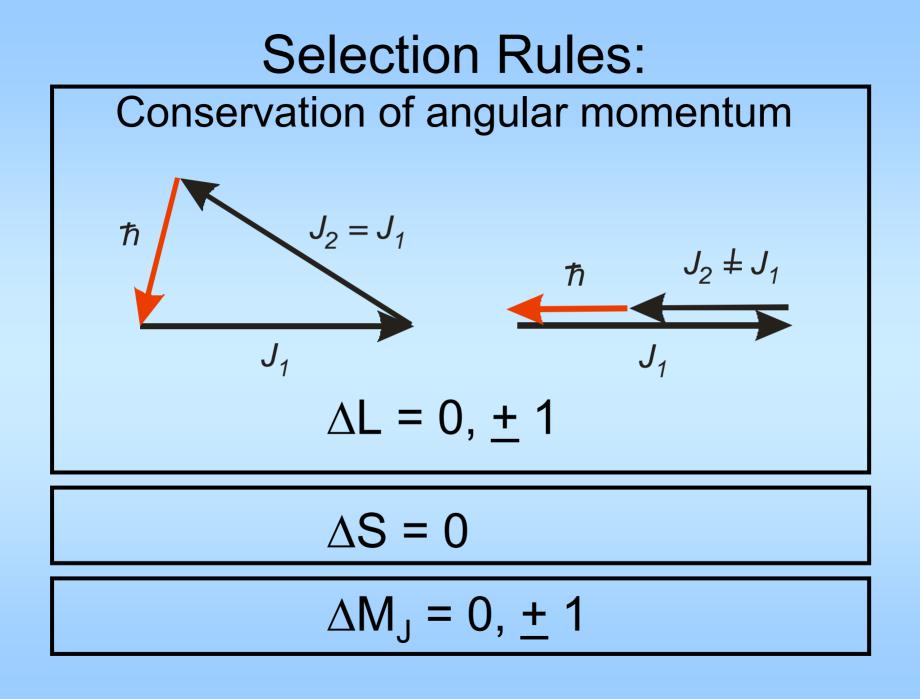

Configuration

$$\left\langle \psi_1(1s)\psi_2(2p)\right|\underline{r}_1+\underline{r}_2\left|\psi_1(3p)\psi_2(3d)\right\rangle$$

 $= \langle \psi_1(1s) | \underline{r}_1 | \psi_1(3p) \rangle \times \langle \psi_2(2p) | \psi_2(3d) \rangle + \langle \psi_2(2p) | \underline{r}_2 | \psi_2(3d) \rangle \times \langle \psi_1(1s) | \psi_1(3p) \rangle$ = 0

Only one electron "jumps"

$$\Delta n = \text{anything}$$
$$\Delta l = \pm 1$$

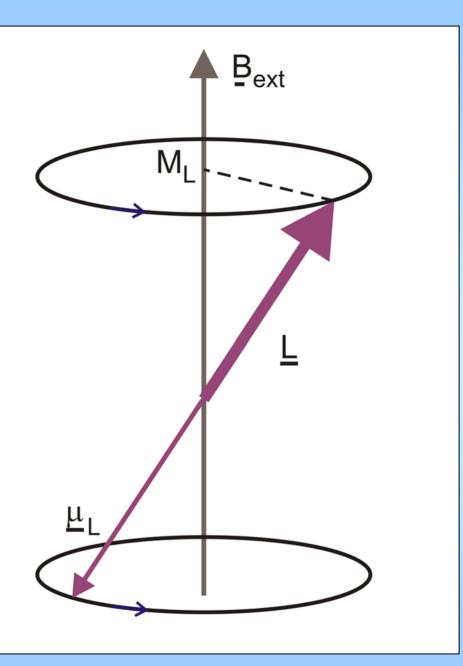

Atoms in magnetic fields

Effect of B-field on an atom with no spin

Interaction energy -Precession energy:

$$\Delta E_{\mathbf{Z}} = -\underline{\mu}_L \cdot \underline{B}_{\text{ext}}$$

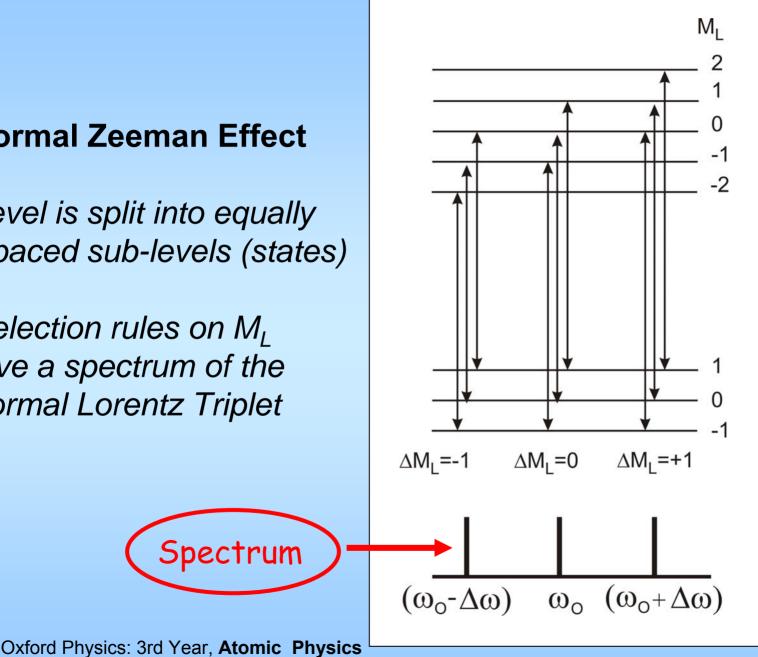

Normal Zeeman Effect

Level is split into equally Spaced sub-levels (states)

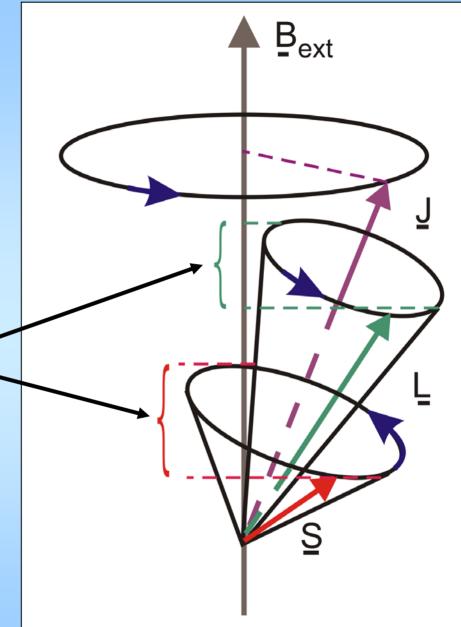

Selection rules on M₁ give a spectrum of the normal Lorentz Triplet

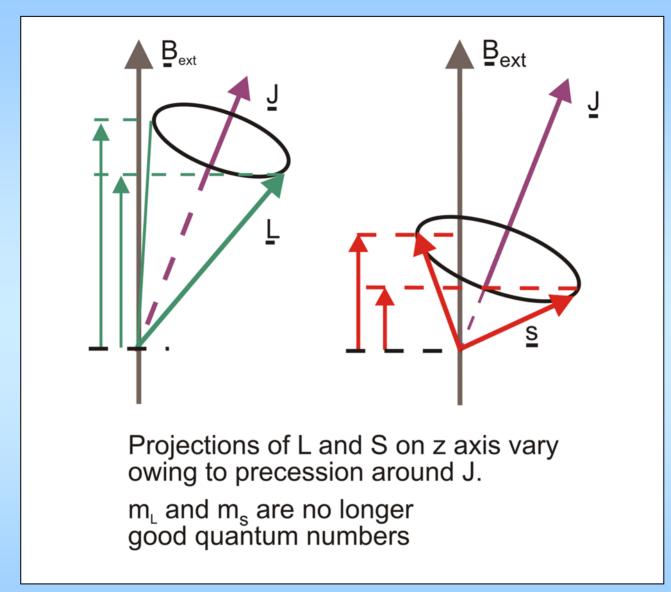

Effect of B-field on an atom with spin-orbit coupling

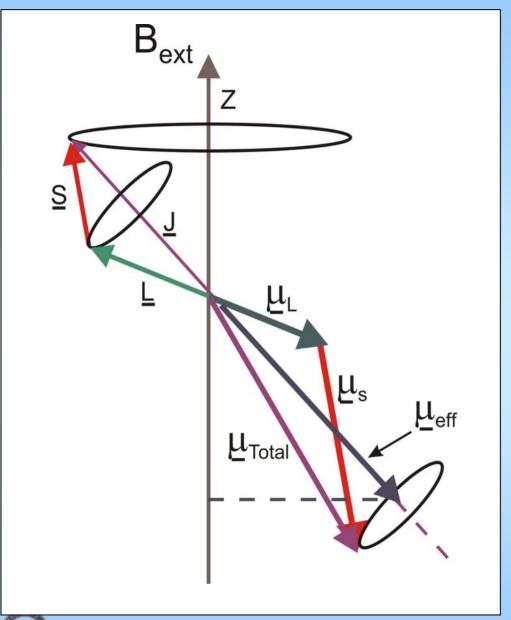

Precession of <u>L</u> and <u>S</u> around the resultant <u>J</u> leads to variation of \leq projections of <u>L</u> and <u>S</u> on the field direction

Total magnetic moment does not lie along axis of <u>J</u>.

Effective magnetic moment does lie along axis of \underline{J} , hence has constant projection on B_{ext} axis

$$\underline{\mu}_{\text{eff}} = g_J \mu_B \underline{J}$$

Perturbation Calculation of B_{ext} effect on spin-orbit level

Interaction energy

$$\hat{H}_{\rm mag} = -\underline{\mu}_{\rm atom} \cdot \underline{B}_{\rm ext}$$

Effective magnetic moment

$$\underline{\mu}_{\text{eff}} = g_J \mu_B \underline{J}$$

Perturbation Theory: expectation value of energy

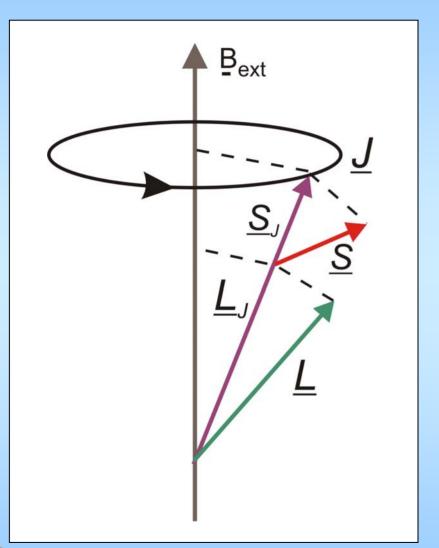

$$\Delta E_{\rm AZ} = g_J \mu_B \left\langle \underline{\hat{J}} \cdot \underline{\hat{B}}_{\rm ext} \right\rangle$$

Energy shift of M₁ level

$$\Delta E_{\rm AZ} = g_J \mu_B \underline{B}_{\rm ext} M_J$$

Vector Model Calculation of B_{ext} effect on spin-orbit level

Projections of \underline{L} and \underline{S} on \underline{J} are given by

$$\frac{|\underline{L} \cdot \underline{J}| \underline{J}|}{|\underline{J}|^2} = \underline{L}_J$$
$$\frac{|\underline{S} \cdot \underline{J}| \underline{J}}{|\underline{J}|^2} = \underline{S}_J$$

J

Vector Model Calculation of B_{ext} effect on spin-orbit level

$$\Delta E_{AZ} = g_L \mu_B \underline{L}_J \cdot \underline{B}_{ext} + g_S \mu_B \underline{S}_J \cdot \underline{B}_{ext}$$
$$= g_L \mu_B \frac{|\underline{L} \cdot \underline{J}|}{|\underline{J}|^2} \underline{J} \cdot \underline{B}_{ext} + g_S \mu_B \frac{|\underline{S} \cdot \underline{J}|}{|\underline{J}|^2} \underline{J} \cdot \underline{B}_{ext}$$

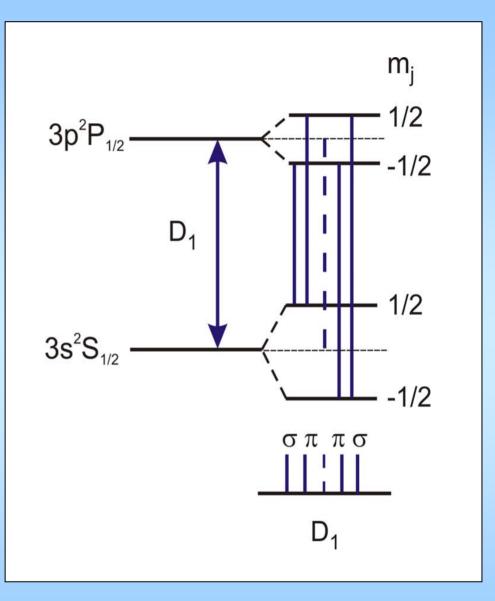

$$\Delta E_{AZ} = \mu_B \frac{\left[3\underline{J}^2 - \underline{L}^2 + \underline{S}^2\right]}{2|\underline{J}|^2} J_z B_{ext}$$

$$\Delta E_{AZ} = \frac{\left[3J(J+1) - L(L+1) + S(S+1)\right]}{2J(J+1)} \mu_B B_{ext} M_J$$
Perturbation Theory result
$$\Delta E_{AZ} = g_J \mu_B \underline{B}_{ext} M_J$$

Perturbation Theory result

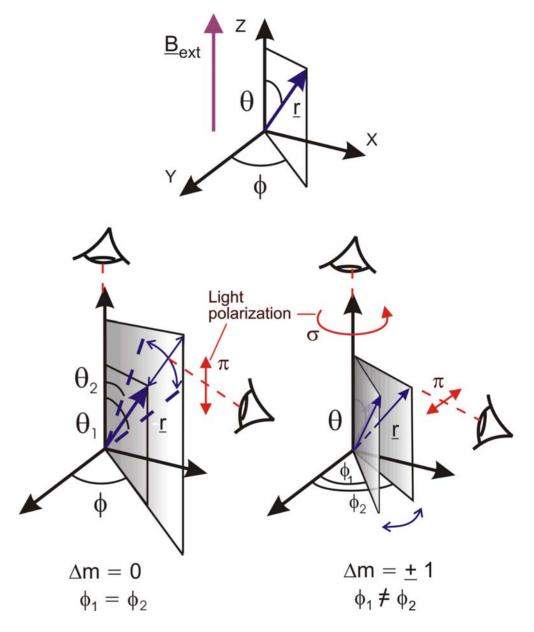

Anomalous Zeeman Effect:

 $3s^2S_{1/2} - 3p^2P_{1/2}$ in Na

Polarization of Anomalous Zeeman components associated with ∆m selection rules

 - Weak field
 - Strong field
- Magnetic field effects on hyperfine structure:
 - Weak field
 - Strong field

Summary of magnetic field effects on atom with spin-orbit interaction

Total magnetic moment does not lie along axis of <u>J</u>.

Effective magnetic moment does lie along axis of \underline{J} , hence has constant projection on B_{ext} axis

$$\underline{\mu}_{\text{eff}} = g_J \mu_B \underline{J}$$

Perturbation Calculation of B_{ext} effect on spin-orbit level

Interaction energy

$$\hat{H}_{\rm mag} = -\underline{\mu}_{\rm atom} \cdot \underline{B}_{\rm ext}$$

Effective magnetic moment

$$\underline{\mu}_{\text{eff}} = g_J \mu_B \underline{J}$$

Perturbation Theory: expectation value of energy

$$\Delta E_{\rm AZ} = g_J \mu_B \left\langle \underline{\hat{J}} \cdot \underline{\hat{B}}_{\rm ext} \right\rangle$$

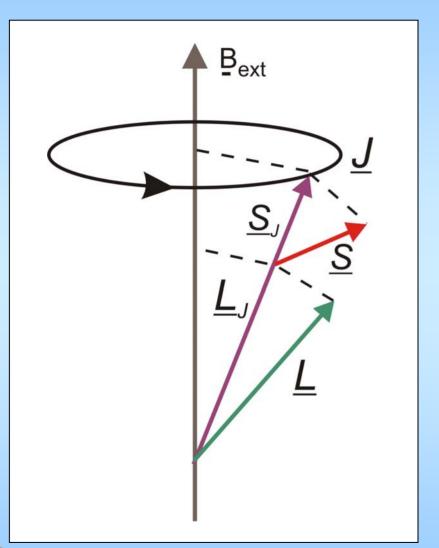

Energy shift of M_J level

$$\Delta E_{\rm AZ} = g_J \mu_B \underline{B}_{\rm ext} M_J$$

What is
$$g_J$$
?

Vector Model Calculation of B_{ext} effect on spin-orbit level

Projections of \underline{L} and \underline{S} on \underline{J} are given by

$$\frac{|\underline{L} \cdot \underline{J}| \underline{J}|}{|\underline{J}|^2} = \underline{L}_J$$
$$\frac{|\underline{S} \cdot \underline{J}| \underline{J}}{|\underline{J}|^2} = \underline{S}_J$$

J

Vector Model Calculation of B_{ext} effect on spin-orbit level

$$\Delta E_{AZ} = g_L \mu_B \underline{L}_J \cdot \underline{B}_{ext} + g_S \mu_B \underline{S}_J \cdot \underline{B}_{ext}$$
$$= g_L \mu_B \frac{|\underline{L} \cdot \underline{J}|}{|\underline{J}|^2} \underline{J} \cdot \underline{B}_{ext} + g_S \mu_B \frac{|\underline{S} \cdot \underline{J}|}{|\underline{J}|^2} \underline{J} \cdot \underline{B}_{ext}$$

$$\Delta E_{AZ} = \mu_B \frac{\left[3\underline{J}^2 - \underline{L}^2 + \underline{S}^2\right]}{2|\underline{J}|^2} J_z B_{ext}$$

$$\Delta E_{AZ} = \frac{\left[3J(J+1) - L(L+1) + S(S+1)\right]}{2J(J+1)} \mu_B B_{ext} M_J$$
Perturbation Theory result
$$\Delta E_{AZ} = g_J \mu_B \underline{B}_{ext} M_J$$

Perturbation Theory result

Landé g-factor

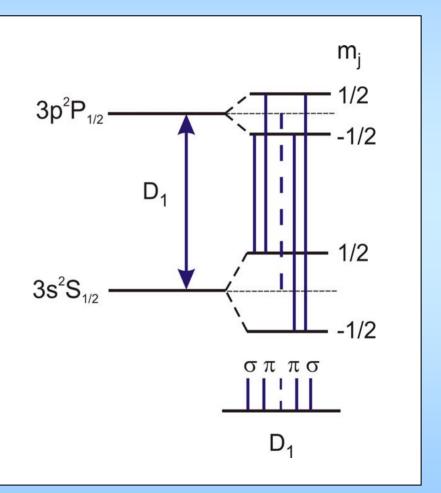

$$g_J = \frac{[3J(J+1) - L(L+1) + S(S+1)]}{2J(J+1)}$$

Anomalous Zeeman Effect:

 $3s^2S_{1/2} - 3p^2P_{1/2}$ in Na

$$g_J({}^2P_{1/2}) = 2/3$$

 $g_J({}^2S_{1/2}) = 2$

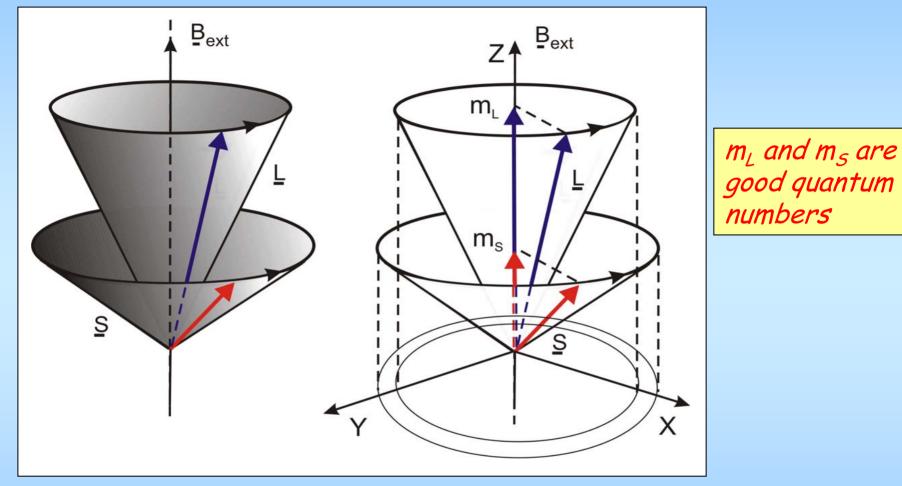

Strong field effects on atoms with spin-orbit coupling

Spin and Orbit magnetic moments couple more strongly to B_{ext} than to each other.

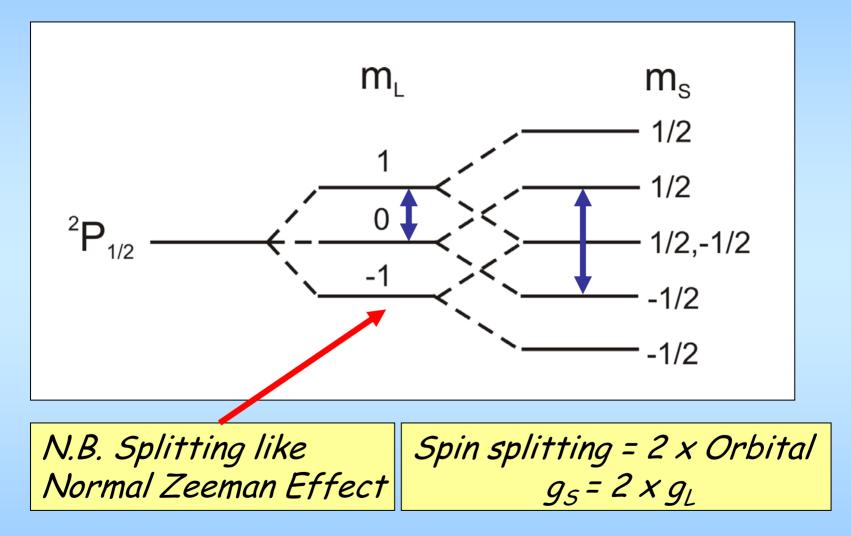

Strong field effect on <u>L</u> and <u>S</u>.

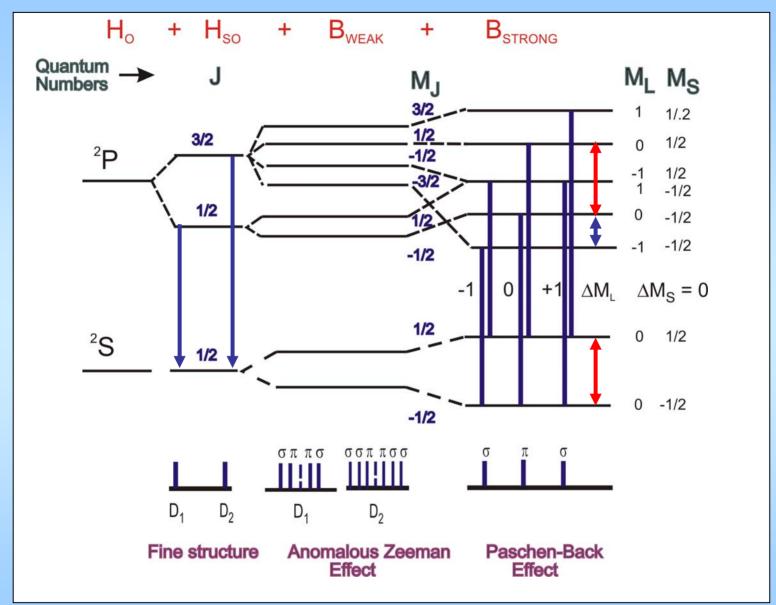

<u>L</u> and <u>S</u> precess independently around <u>B</u>_{ext}

Spin-orbit coupling is relatively insignificant

Splitting of level in strong field: Paschen-Back Effect

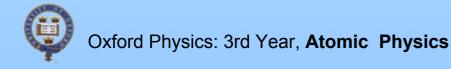

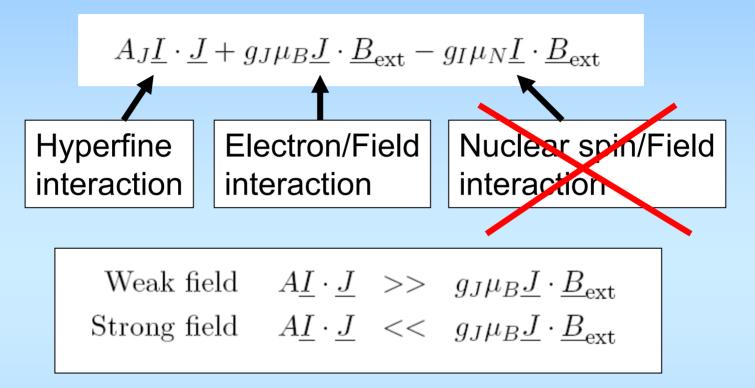

Oxford Physics: 3rd Year, Atomic Physics

Magnetic field effects on hyperfine structure

Hyperfine structure in Magnetic Fields

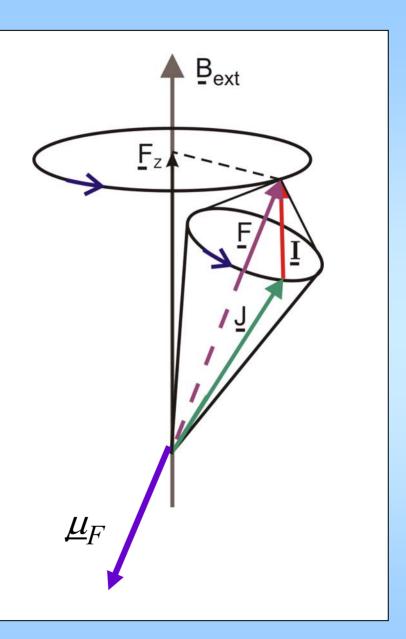

Weak field effect on hyperfine structure

<u>I</u> and <u>J</u> precess rapidly around <u>F</u>. <u>F</u> precesses slowly around B_{ext}

I, J, F and M_F are good quantum numbers

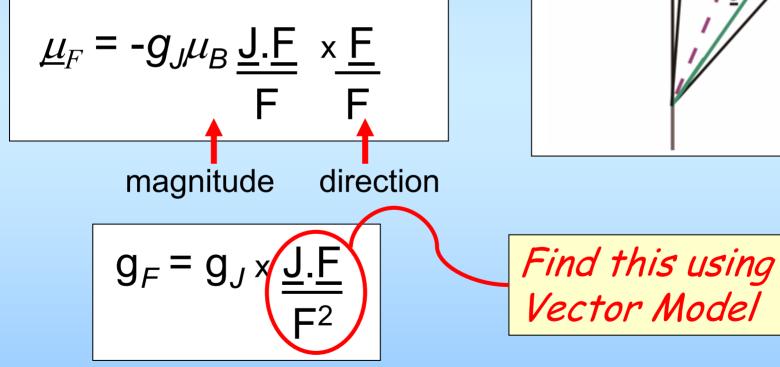

$$\underline{\mu}_F = -g_F \mu_B \underline{F}$$

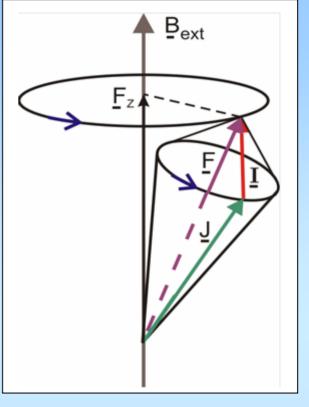

$$\underline{\mu}_F = -g_F \mu_B \underline{F}$$

Only contribution to μ_F is component of μ_J along <u>F</u>

$$g_F = g_J \times \underline{J.F}$$

 F^2

$$E = I + J$$

$$I^{2} = E^{2} + J^{2} - 2J.E$$

$$J.E = \frac{1}{2} \{F(F+1) + J(J+1) - I(I+1)\}$$

$$g_F = g_J \frac{F(F+1) + J(J+1) - I(I+1)}{2F(F+1)}$$

$$\Delta E = A_J \underline{I} \cdot \underline{J} + g_J \mu_B \underline{J} \cdot \underline{B}_{\text{ext}}$$

$$\Delta E = \frac{A_F}{2} \left\{ F(F+1) - J(J+1) - I(I+1) \right\} + g_F \mu_B \underline{F} \cdot \underline{B}_{\text{ext}}$$

- N.B. notes error eqn 207

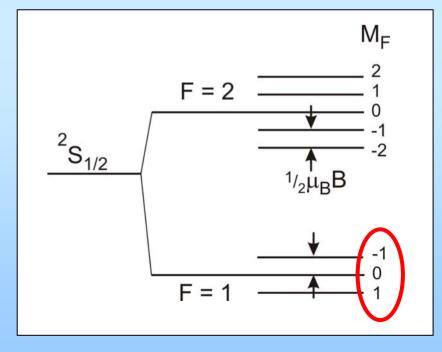

Each hyperfine level is split by g_F term

Ground level of Na:

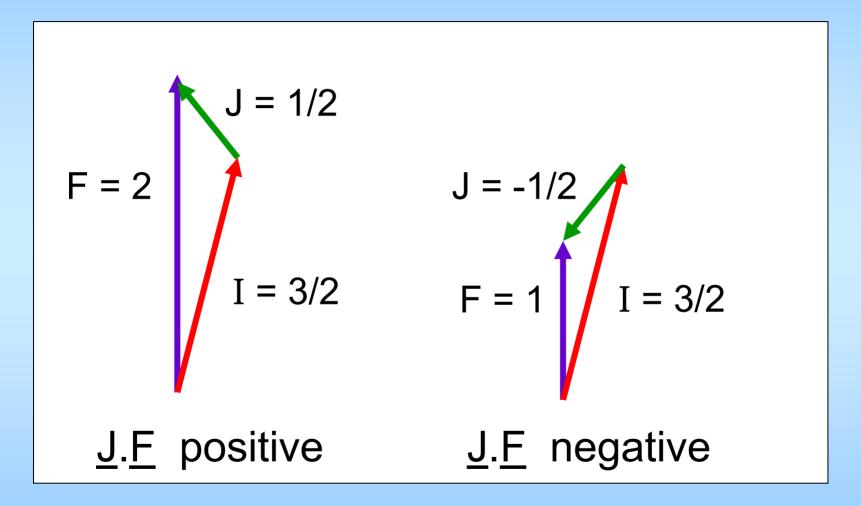

$$J = 1/2$$
; $I = 3/2$;
F = 1 or 2

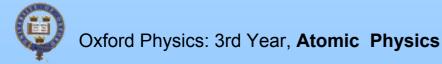

.

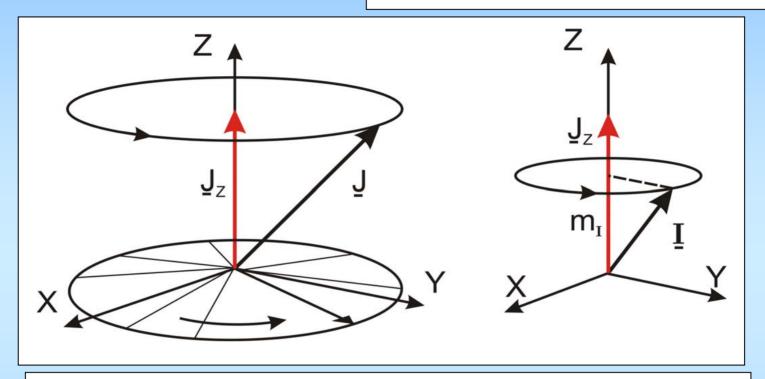

Sign inversion of g_F for F = 1 and F = 2

Strong field effect on hfs.

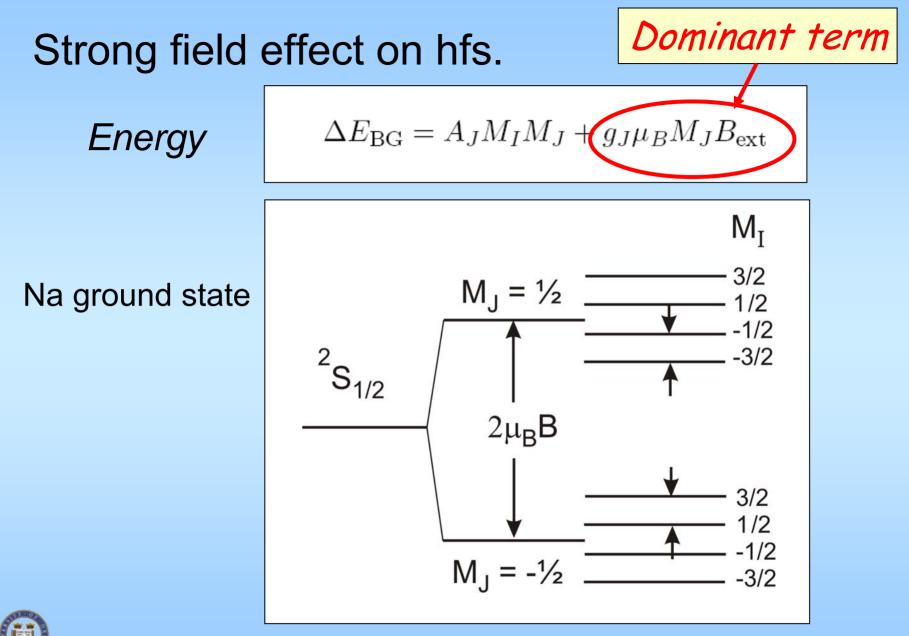

$$\Delta E = A_J \underline{I} \cdot \underline{J} + g_J \mu_B \underline{J} \cdot \underline{B}_{\text{ext}}$$

 $\frac{J}{I} \text{ precesses rapidly around } B_{ext} (z-axis)$ $\frac{I}{I} \text{ tries to precess around } \frac{J}{I} \text{ but can follow only the}$ time averaged component along z-axis i.e. J_z

So
$$A_J \underline{I}.\underline{J}$$
 term $\rightarrow A_J M_I M_J$

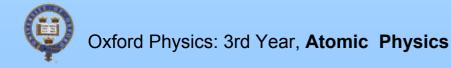

Strong field effect on hfs.

Energy:
$$\Delta E = A_J \underline{I} \cdot \underline{J} + g_J \mu_B \underline{J} \cdot \underline{B}_{ext}$$

- J precesses around field B_{ext}
- I tries to precess around J
- I precesses around what it can "see" of <u>J</u>: The z-component of <u>J</u>: \underline{J}_{Z}

$$\Delta E_{\rm BG} = A_J M_I M_J + g_J \mu_B M_J B_{\rm ext}$$

Magnetic field effects on hfs

<u>**Weak field:**</u> F, M_F are good quantum nos. Resolve μ_J along <u>F</u> to get effective magnetic moment and g_F

 $\Delta E(F,M_F) = g_F \mu_B M_F B_{ext}$

 \rightarrow "Zeeman" splitting of hfs levels

<u>Strong field:</u> M_I and M_J are good quantum nos.

<u>J</u> precesses rapidly around B_{ext} ; <u>I</u> precesses around z-component of J i.e. what it can "see" of <u>J</u>

$$\Delta E(M_J,M_I) = g_J \mu_B M_J B_{ext} + A_J M_I M_J$$

 \rightarrow hfs of "Zeeman" split levels

- X-rays: excitation of "inner-shell" electrons
- High resolution laser spectroscopy
 - The Doppler effect
 - Laser spectroscopy
 - "Doppler-free" spectroscopy

X – Ray Spectra

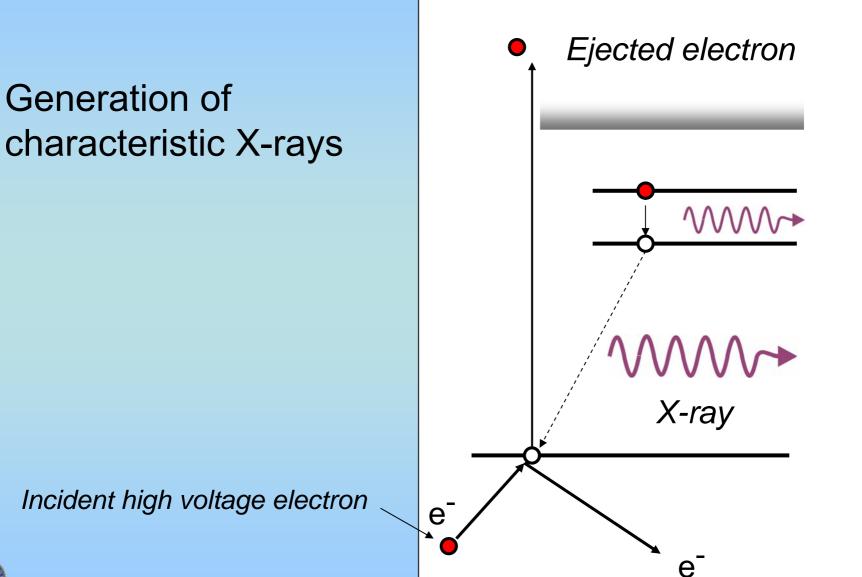

Characteristic X-rays

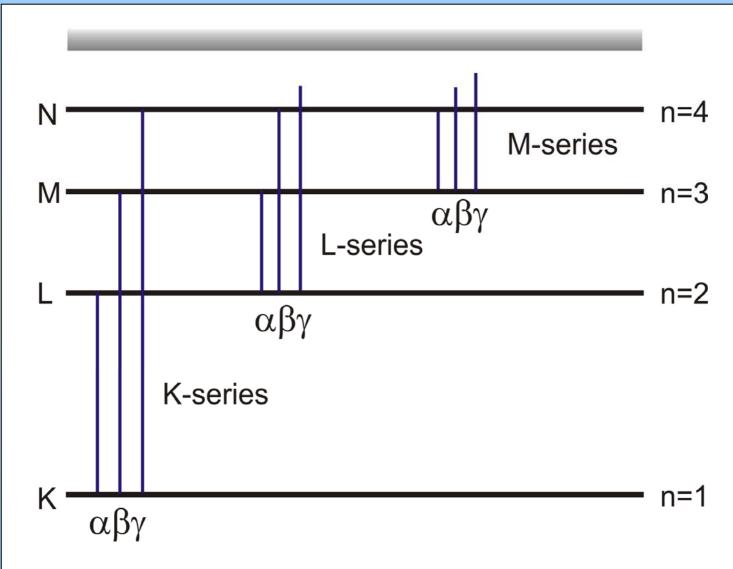

- Wavelengths fit a simple series formula
- All lines of a series appear together — when excitation exceeds threshold value
- Threshold energy just exceeds energy of shortest wavelength X-rays
- Above a certain energy no new series appear.

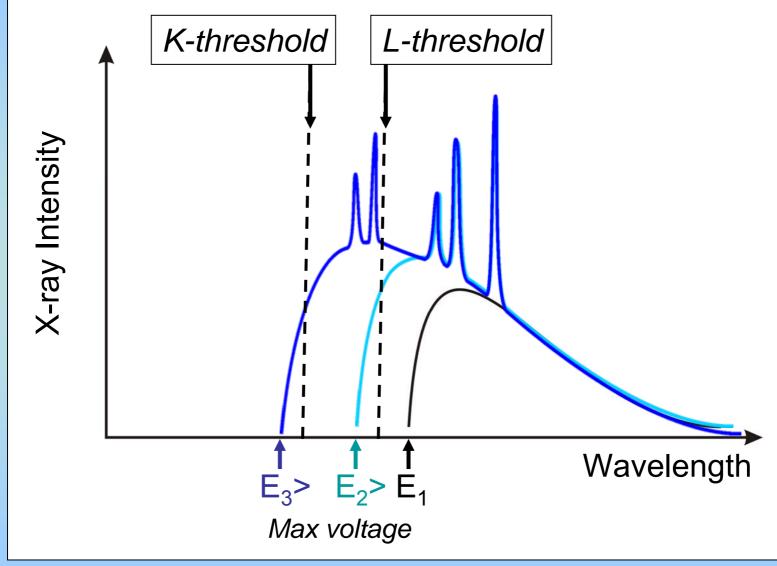

Oxford Physics: 3rd Year, Atomic Physics

X-ray spectra for increasing electron impact energy

Binding energy for electron in hydrogen = R/n^2

Binding energy for "hydrogen-like" system = RZ^2/n^2

Screening by other electrons in inner shells: $Z \rightarrow (Z-\sigma)$

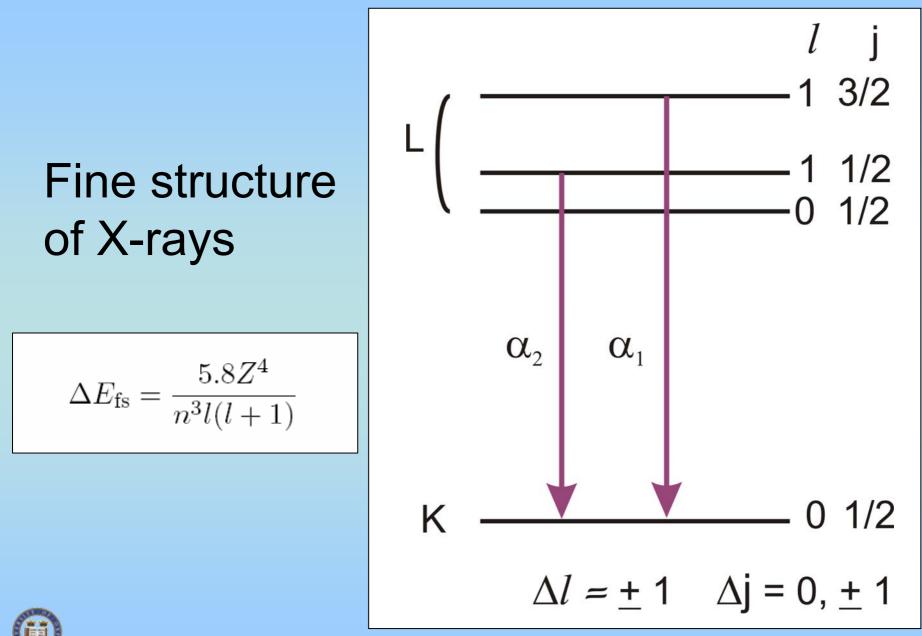

Binding energy of inner-shell electron:

$$\mathbf{E}_{\mathrm{n}} = \mathbf{R}(\mathbf{Z} - \boldsymbol{\sigma})^2 / \mathrm{n}^2$$

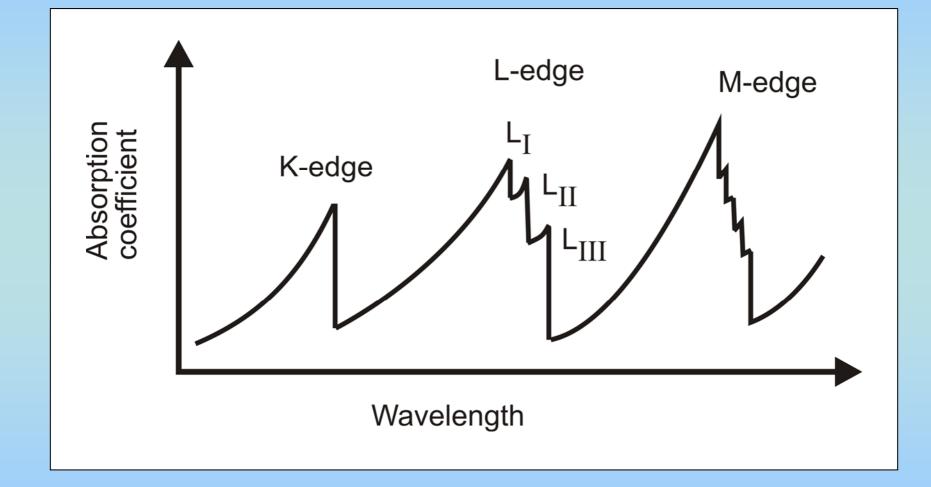

Transitions between inner-shells:

$$E_{n} - E_{m} = \overline{v} = R\{(Z - \sigma_{i})^{2} / n_{i}^{2} - (Z - \sigma_{j})^{2} / n_{j}^{2}\}$$

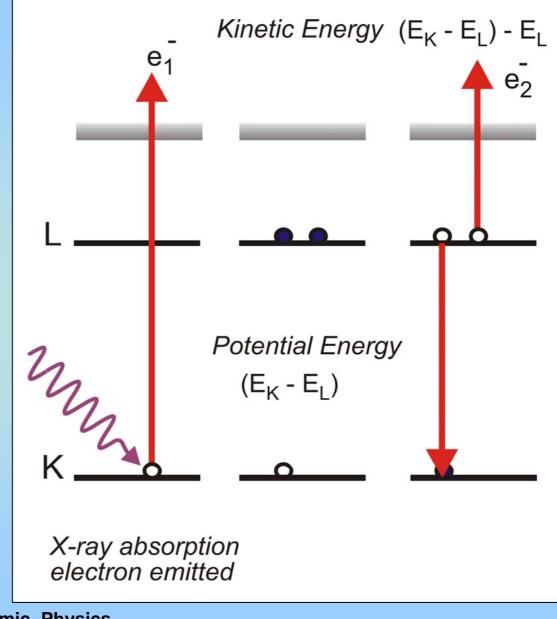

X-ray absorption spectra

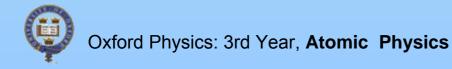

Auger effect

High resolution laser spectroscopy

Doppler broadening

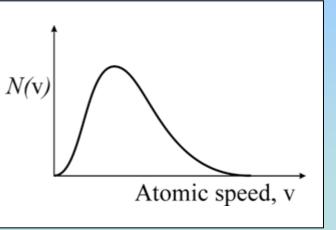

Doppler Shift:

$$\nu = \nu_0 \left(1 \pm \frac{v}{c} \right)$$

Maxwell-Boltzmann distribution of

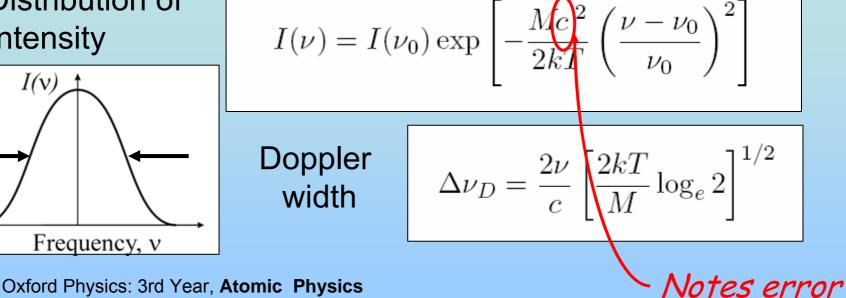

Atomic speeds

$$dN = N_0 e^{-\frac{Mv^2}{2kT}} dv$$

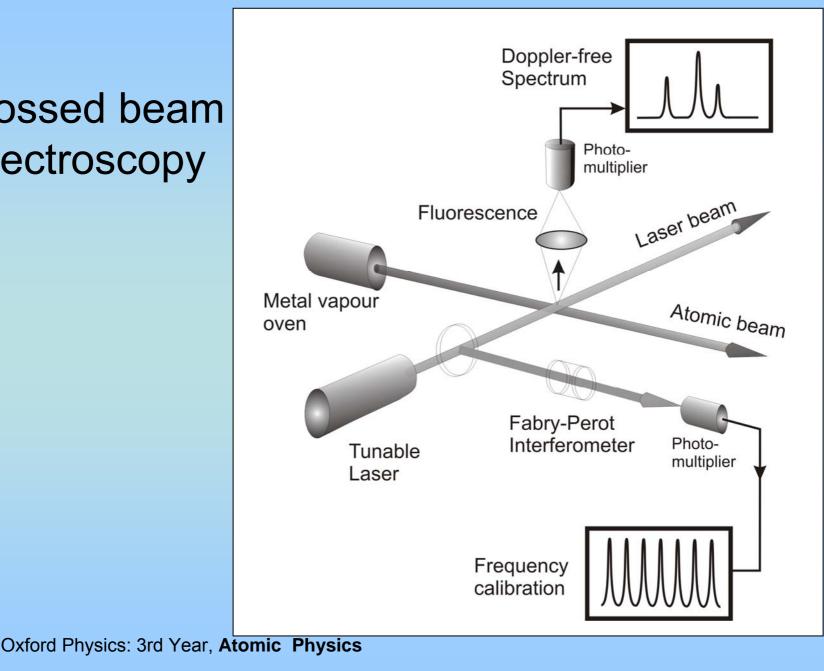

Distribution of Intensity

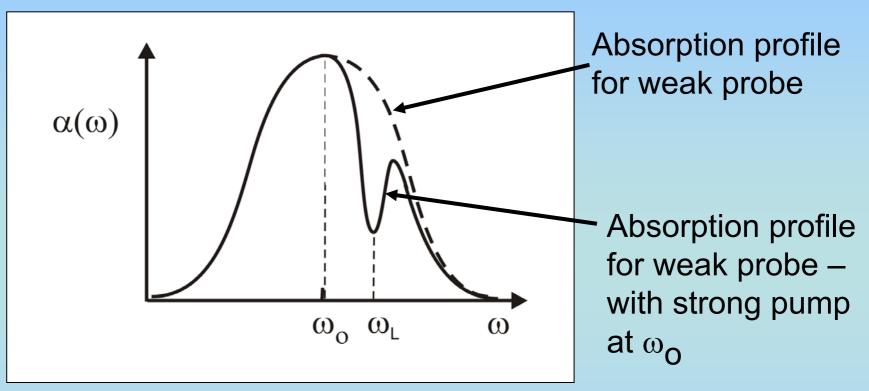

I(v)

Crossed beam Spectroscopy

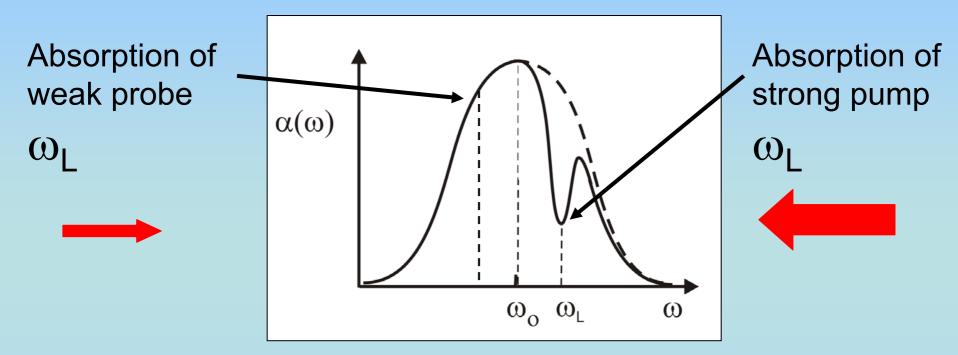

Saturation effect on absorption

Strong pump at ω_{L} reduces population of ground state for atoms Doppler shifted by $(\omega_{L} - \omega_{o})$. Hence reduced absorption for this group of atoms.

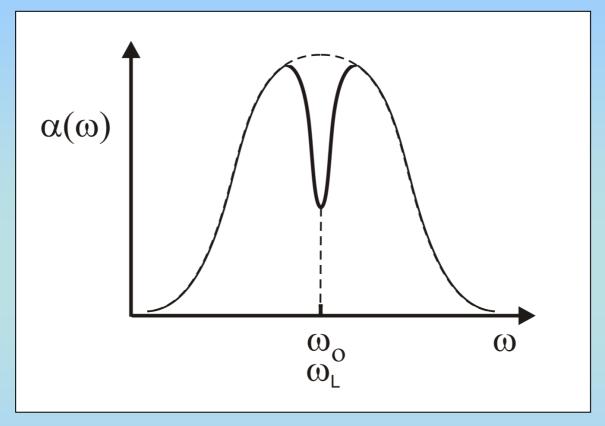

Saturation effect on absorption

Probe and pump laser at same frequency ω_L But propagating in opposite directions Probe Doppler shifted down = Pump Doppler shifted up. Hence probe and pump "see" different atoms.

Saturation of "zero velocity" group at ω_{O}

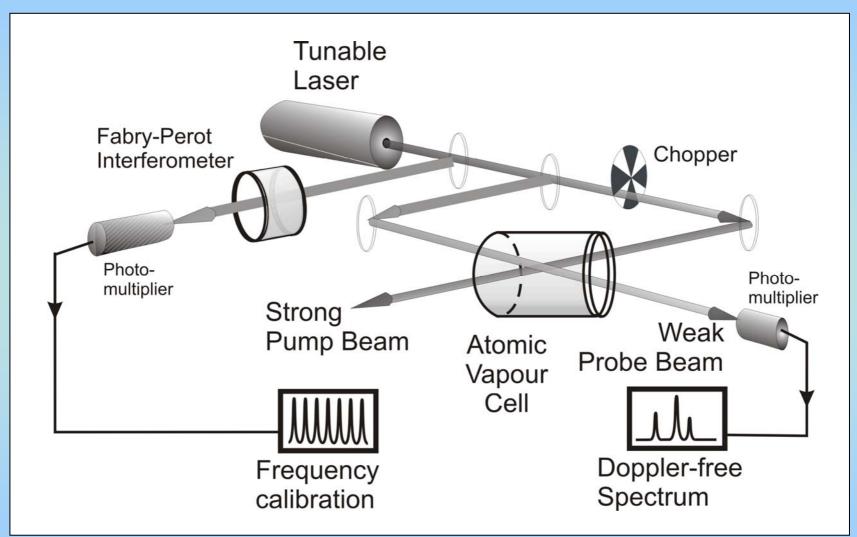

Counter-propagating pump and probe

"see" same atoms at $\omega_L = \omega_O$

i.e. atoms moving with zero velocity relative to light

Saturation spectroscopy

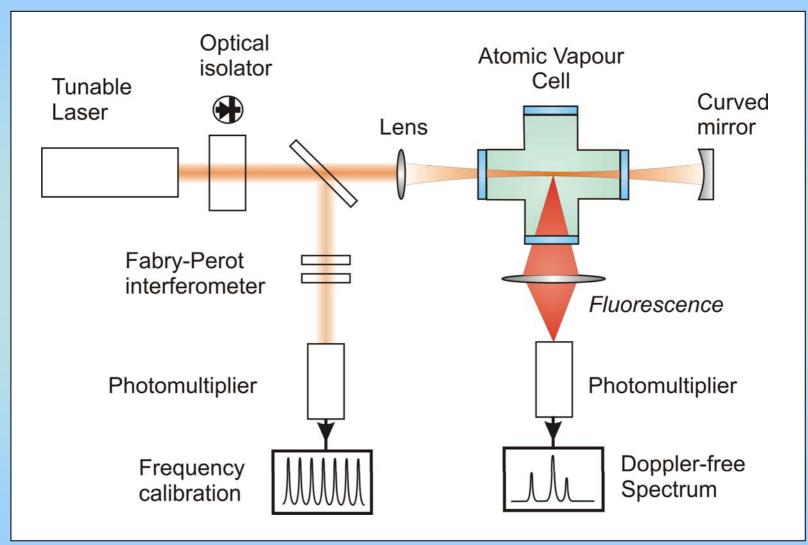

Principle of Doppler-free two-photon absorption

$$E = h\nu(1 + v/c) + h\nu(1 - v/c) = 2h\nu$$

Photon Doppler shifted up + Photon Doppler shifted down

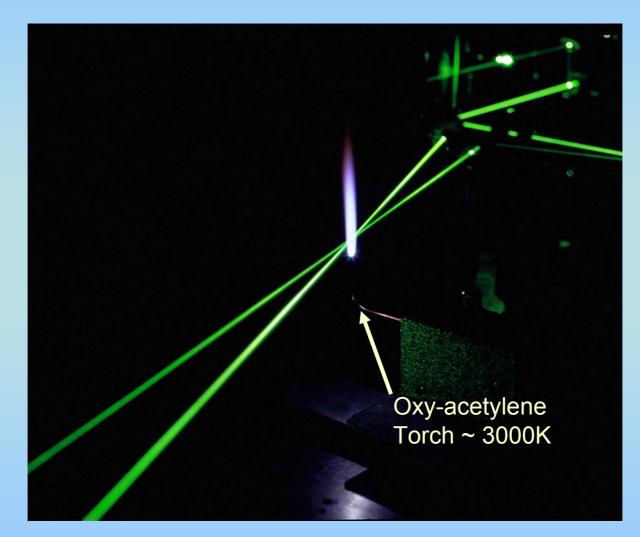

Two-photon absorption spectroscopy

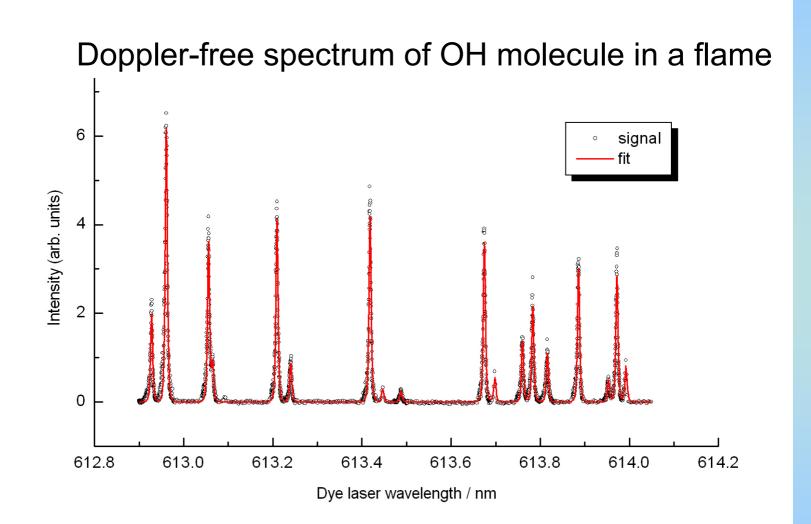

Doppler-free spectroscopy of molecules in high temperature flames

The End
